Station No. 1.—Summit of Mount Washington. Elevation of barometer above sea-level.. 6,285.4 feet.
Station No. 2.—Above Jacob's Ladder. Elevation of barometer above sea-level........... 5,553.3 feet.
Station No. 3.—Waumbeck House. Elevation of barometer above sea-level............... 4,058.7 feet.
Station No. 4.—Base of Mount Washington. Elevation of barometer above sea-level ..... 2,898.3 feet.

NOTE.—Barometer-readings corrected for temperature and instrumental error only.

Meteorological record for June 16, 1873.

(Minute barometrical observations.)

Place of observation.	Time of observation.	Barometer.	Attached thermometer.	Corrected barometer.	Place of observation.	Time of observation.	Barometer.	Attached thermometer.	Corrected barometer. Station No. 1.—Summit of Mount Washington. Elevation of barometer above sea-level.. 6,285.4 feet.
Station No. 2.—Above Jacob's Ladder. Elevation of barometer above sea-level........... 5,153.3 feet.
Station No. 3.—Waumbeck House. Elevation of barometer above sea-level .... 4,058.7 feet.
Station No. 4.—Base of Mount Washington. Elevation of barometer above sea-level ..... 2,898.3 feet.

NOTE.—Barometer-readings corrected for temperature and instrumental error only.

Meteorological record for June 16, 1873.

(Minute barometrical observations.)

Station No. 1.—Summit of Mount Washington. Elevation of barometer above sea-level.. 6,285.4 feet.
Station No. 2.—Above Jacob's Ladder. Elevation of barometer above sea-level .... 5,553.3 feet.
Station No. 3.—Waumbeck House. Elevation of barometer above sea-level .... 4,058.7 feet.
Station No. 4.—Base of Mount Washington. Elevation of barometer above sea-level ..... 2,898.3 feet.

Note.—Barometer-readings corrected for temperature and instrumental error only.

Meteorological record for June 19, 1873.

(Minute barometrical observations.)

Place of observation.	Time of observation.	Barometer.	Attached thermometer.	Corrected barometer.	Place of observation.	Time of observation.	Barometer.	Attached thermometer.	Corrected barometer. Station No. 1.—Summit of Mount Washington. Elevation of barometer above sea-level.. 6,285.4 feet.
Station No. 1.—Above Jacob's Ladder. Elevation of barometer above sea-level............ 5,553.3 feet.
Station No. 3.—Waumbeck House. Elevation of barometer above sea-level................ 4,058.7 feet
Station No. 4.—Base of Mount Washington. Elevation of barometer above sea-level...... 2,898.3 feet

NOTE.—Barometer-readings corrected for temperature and instrumental error only.

Meteorological record for June 20, 1873.

(Minute barometrical observations.)

Station No. 1.—Summit of Mount Washington. Elevation of barometer above sea-level.. 6,285.4 feet.
Station No. 2.—Above Jacob's Ladder. Elevation of barometer above sea-level .... 5,553.3 feet.
Station No. 3.—Waumbeck House. Elevation of barometer above sea-level.............. 4,058.7 feet.
Station No. 4.—Base of Mount Washington. Elevation of barometer above sea-level...... 2,898.3 feet.

NOTE.—Barometer-readings corrected for temperature and instrumental error only.

Meteorological record for June 23, 1873.

(Minute barometrical observations.)

Place of observation.	Time of observation.	Barometer.	Attached thermometer.	Corrected barometer.	Place of observation.	Time of observation.	Barometer.	Attached thermometer.	Corrected barometer. Station No. 1.—Summit of Mount Washington. Elevation of barometer above sea-level.. 6,285.4 feet.
Station No. 2.—Above Jacob's Ladder. Elevation of barometer above sea-level.......... 5,553.3 feet.
Station No. 3.—Waumbeck House. Elevation of barometer above sea-level............. 4,058.7 feet.
Station No. 4.—Base of Mount Washington. Elevation of barometer above sea-level.... 2,898.3 feet.

NOTE.—Barometer-readings corrected for temperature and instrumental error only

Meteorological record for June 27, 1873.

(Minute barometrical observations.)

Station No. 1.—Summit of Mount Washington. Elevation of barometer above sea-level.. 6,285.4 feet.
Station No. 2.—Above Jacob's Ladder. Elevation of barometer above sea-level.......... 5,553.3 feet.
Station No. 3.—Waumbeck House. Elevation of barometer above sea-level.............. 4,058.7 feet.
Station No. 4.—Base of Mount Washington. Elevation of barometer above sea-level..... 2,898.3 feet.

NOTE.—Barometer-readings corrected for temperature and instrumental error only.

Meteorological record for June 28, 1873.

(Minute barometrical observations.)

Station No. 1.—Summit of Mount Washington. Elevation of barometer above sea-level ... 6,285.4 feet.
Station No. 2.—Above Jacob's Ladder. Elevation of barometer above sea-level .... 5,553.3 feet.
Station No. 3.—Waumbeck House. Elevation of barometer above sea-level .... 4,058.7 feet.
Station No. 4.—Base of Mount Washington. Elevation of barometer above sea-level....... 2,898.3 feet.

NOTE.—Barometer-readings corrected for temperature and instrumental error only.

K.—*Meteorological record for May* 1, 1873.

(Hourly observation.)

NOTE.—Elevation of barometer at summit above sea-level, 6,285.4 feet. Elevation of barometer at base above sea-level, 2,898.3 feet. Barometer-readings corrected for temperature and instrumental error only.

L.—Meteorological record for June 1, 1873.

(Hourly observations.)

NOTE.—Station No. 1, Summit of Mount Washington. Elevation of barometer above sea-level, 6,285.4 feet; **Station No. 2, Above Jacob's Ladder.** Elevation of barometer above sea-level, 5,553.3 feet; Station No. 3, Waumbeck House. Elevation of barometer above sea-level, 4,058.7; **Station No. 4, Base of Mount Washington.** Elevation of barometer above sea-level, 2,898.3. The elevation of barometers above sea-level at Stations Nos. 2, 3, and 4 were calculated from the synchronous barometrical observation taken during the month of June, 1873. Barometer-readings corrected for temperature and instrumental error only.

L.—*Meteorological record for June 1, 1873.*

(Hourly observations.)

Note.—Station No. 1, Summit of Mount Washington. Elevation of barometer above sea-level, 6,285.4 feet; Station No. 2, Above Jacob's Ladder. Elevation of barometer above sea-level, 5,553.3 feet; Station No. 3, Waumbeck House. Elevation of barometer above sea-level, 4,058.7; Station No. 4, Base of Mount Washington. Elevation of barometer above sea-level, 2,898.3. The elevation of barometers above sea-level at Stations Nos. 2, 3, and 4 were calculated from the synchronous barometrical observation taken during the month of June, 1873. Barometer-readings corrected for temperature and instrumental error only.

Place of observation.	Time of observation.	Barometer.	THERM.		Corrected barometer.	HYGROM.		Relative humidity.	WIND.				LOWER CLOUDS.		UPPER CLOUDS.			RAIN OR SNOW.		Amount of rain or melted snow.	Remarks.
			Attached.	Exposed.		Dry bulb.	Wet bulb.		Direction.	Velocity per hour.	Pressure per sq. ft.	Daily velocity.	Kind.	Amount.	Kind.	Amount.	Direction, (moving from—)	Comme'd.	Ended.

PAPER 16.

REPORT OF METEOROLOGICAL OBSERVATIONS MADE AT MOUNT MITCHELL DURING THE MONTHS OF MAY, JUNE, JULY, AUGUST, AND PART OF SEPTEMBER, 1873.

WAR DEPARTMENT,
OFFICE OF THE CHIEF SIGNAL-OFFICER,
DIVISION OF TELEGRAMS AND REPORTS FOR THE
BENEFIT OF COMMERCE AND AGRICULTURE,
Washington, D. C., September 23, 1873.

SIR: I have the honor to submit the following report of the special observations made on the summit of Mount Mitchell from May 11, 1873, to August 6, 1873, and both summit and base from the latter date to September 6, 1873. The barometers at both stations were carefully compared before leaving the office and also upon their return. Papers A and B, herewith, give in detail the instructions to the observers. Papers C, D, E, and F, are the journals kept at the summit, and Paper G that at the base-station. Papers H and I give the observations made at both stations, and, for purposes of comparison, those made at Knoxville, Tenn., during the same period. Knoxville was selected from the fact that its elevation is supposed to be accurately determined. The barometrical observations have been corrected for temperature and instrumental error only. The elevation of the barometer at summit above sea-level is assumed to be 6,691 feet; at base, 2,560 feet; at Knoxville, 993 feet.

Very respectfully, &c.,

H. W. HOWGATE,
Second Lieut. and Bvt. Capt. U. S. A., A. S. O. and Assistant.

CHIEF SIGNAL-OFFICER, U. S. A.,
Washington, D. C.

A.

WAR DEPARTMENT,
OFFICE OF THE CHIEF SIGNAL-OFFICER,
DIVISION OF TELEGRAMS AND REPORTS FOR THE
BENEFIT OF COMMERCE AND AGRICULTURE,
Washington, D. C., April 26, 1873.

SERGEANT: Upon arriving at the summit of Mount Mitchell, in compliance with Special Orders No. 55, of this date, you will make suitable preparations for beginning a series of observations at 6 o'clock a. m. of May 1, and continuing them, without interruption, until midnight of May 31, at the following hours daily: 1 a. m., 2 a. m., 3 a. m., 4 a. m., 5 a. m., 6 a. m., 7.14 a. m., 8 a. m., 9 a. m., 10 a. m., 11 a. m., 12 m., 1 p. m., 2 p. m., 3 p. m., 4.14 p. m., 5 p. m., 6 p. m., 7 p. m., 8 p. m., 9 p. m., 10.39 p. m., and 12 midnight.

In making these observations local time will be used, which is twenty-one (21) minutes slower than Washington time. The observations will be the same in all respects as those made at regular stations, and will be recorded in the usual manner, upon Forms 4, omitting only the reduction of the barometric observations for elevation. The records of the party will be kept, under your supervision, by Sergeant Dietz, and will be brought by you in person to this office when ordered in, unless otherwise instructed in the mean time as to their disposition. The several instruments will be properly exposed, using the portable shelter as far as practicable, and read in the following order:

1. Attached thermometer.
2. Barometer.
3. Thermometer.
4. Hygrometer.
5. Wind-vane.
6. Anemometer.
7. Rain-gauge.

All observations will be entered as made in the "Original Record" book. In addition to a full supply of necessary forms, books of record, and articles of stationery, the following instruments will be furnished you:

2 barometers, mercurial.
2 standard thermometers.
2 hygrometers.
2 anemometers.

2 wind-vanes, small.
1 rain-gauge.
1 self-registering anemometer attachment, with battery and insulated wire.

Especial pains will be taken to secure a continuous record from the self-registering apparatus, and to preserve the record in proper condition for future use. All instruments and supplies will be taken charge of by you at this office. The former will be carried by yourself and the members of your party, and the latter must accompany you so as to reach the railroad-station nearest the mountain at the same time with the party. Upon arriving at Old Fort, the present terminus of the railroad, you will at once secure the necessary means of transportation for your party and supplies to the summit of the mountain, about thirteen miles distant. You will also ascertain from Col. D. C. Salsbury whether provisions in sufficient quantity can be obtained at or near the base of the mountain, and if not, will purchase and take with you enough to last the party five weeks. Water in abundance will be found within a few feet of the summit, and an old log-cabin on the summit can be used for shelter for the whole party. You have been selected to lead this party on account of your experience as an observer and thorough knowledge of station-duties, and it is expected that you will use your best efforts to make the expedition a successful one by the accuracy of the observations and the neatness of the records.

The utmost expedition must necessarily be used in order to reach the ground and get ready for work at the date and time ordered, and it is possible that you may be compelled to leave one man behind at the railroad-station to bring up the supplies, while the remainder of the party pushes forward to the mountain with the instruments to begin the observations.

In expending such public money as may be intrusted you for public expenses, the utmost economy must be exercised, and a carefully itemized account kept of all such expenditures.

Very respectfully,

H. W. HOWGATE,
Second Lieut. and Bvt. Capt. U. S. A., A. S. O. and Asst.

Sergt. WILLIAM E. SMITH,
Washington, D. C.

B.

WAR DEPARTMENT,
OFFICE OF THE CHIEF SIGNAL-OFFICER,
DIVISION OF TELEGRAMS AND REPORTS FOR THE
BENEFIT OF COMMERCE AND AGRICULTURE,
Washington, D. C., *July* 26, 1873.

SERGEANT: On arriving at Mount Mitchell you will put yourself at once in communication with Sergeant Smith, in charge of the summit station, and, after a careful comparison of your barometers and time-pieces with those in use at that station, will note the difference in your journal, and then proceed to some point at or near the base of the mountain, from which the summit can be distinctly seen, and there establish a station, at which you will make observations daily at the following-named hours, (local time,) until further orders, viz: 1 a. m., 2 a. m., 3 a. m., 4 a. m., 5 a. m., 6 a. m., 7.14 a. m., 8 a. m., 9 a. m., 10 a. m., 11 a. m., 12 noon; 1 p. m., 2 p. m., 3 p. m., 4.14 p. m., 5 p. m., 6 p. m., 7 p. m., 8 p. m., 9 p. m., 10 p. m., 10.39 p. m., 12 midnight. To insure similarity in time you will twice each day (8 a. m. and 4 p. m.) compare your time with that at the summit, by signals, using for this purpose the flags furnished, and of which one set will be turned over to Sergeant Smith at the summit station. The time-keeper at the summit will be used as the standard, and yours made to correspond with it at all times. Your station at the base must be located at or as near the general level of the surrounding country as possible, and its elevation above the railroad-track ascertained, if practicable. It is not necessary that you should have your station immediately at the base of the mountain, if there is any other point from which the summit can be better seen and communicated with.

Very respectfully,

H. W. HOWGATE,
Second Lieut. and Bvt. Capt. U. S A., A. S. O. and Asst.

Sergt. D. H. SACKETT,
Washington, D. C.

C.

Abstract of daily journal kept on Mount Mitchell, North Carolina, during the month of Ma 1873.

May 1, 1873.—Arrived at 1 a. m. at the Mountain House, which is about 4,600 fee above the level of the sea, under heavy rain, with brisk and high southeast to eas winds. The guides refusing to proceed any farther under such weather, made a dela necessary. Rain continued without interruption until midnight, and wind increase to very high.

May 2.—Rainy in the early morning, with very dense fog and brisk southeast win until 10 a. m. Wind veering to north and rain ceased, with falling temperature Started for the peak at 1 p. m., sending ahead the guides to clear the path with axes Arrived at Mitchell's Peak at 6.30 p. m. Toward 7 p. m. snow commenced to fal which soon changed to sleet, with increasing wind blowing from southeast, and wit very low temperature, coating the trees and rocks with a thick layer of ice.

May 3.—Commenced to build a temporary instrument-shelter, and finished it by 1 m., and began to make observations. Wind blowing brisk from the west, with lov temperature and light snow. Wind veering to north at 2.25 p. m., and at 4.40 p. m. t northeast, sleeting and hailing until 6 30 p. m. Wind backing to west and northwest with slightly increased temperature, but still being below the freezing-point. Dens fog until midnight.

May 4.—Still dense fog and fresh and brisk northwest wind, which calmed down to a absolute calm at 9 a. m. Light north and west until noon, when the fog disappeare and disclosed cirrus and cumulus clouds. A second calm at 4.14 p. m., wind veering t southeast and east. Fog throughout the remainder of the day.

May 5.—Very foggy and damp weather, with fresh east wind. The fog above thi station disappeared at 7.28 a. m., disclosing cirrus and cumulus clouds, but the whol region below this station was still hidden from view by fog until 9 a. m., when a dense fo enveloped the peak; wind in the mean time veering to southwest, being light, an calming entirely. The fog nearly disappeared at 5.32, with wind backing to south an southeast. Sky covered with cumulus clouds, and after their disappearance, at 9.03 the weather was fair for a few hours, with only a light fog in the valley. A halo wa visible from 9 p. m. to midnight. At midnight the weather was foggy again.

May 6.—Foggy in the earlier part of the day. Partly fair and clear at 3 a. m., an continued fair until 6 a. m., with fresh east wind. Dense fog until 9 a. m., when light rain commenced and continued until noon, and afterward heavy rain with slee and hail. Temperature falling and wind increasing to brisk and high. The roof o the instrument-shelter was blown down, breaking the wet-bulb of the hygrometer, an making an immediate removal of all instruments to a place of safety absolutely necessary, which place (an overhanging rock) made a reading of them impossible. Th storm increased in violence, and heavy rain, mingled with snow and sleet, fell i streams, compelling the whole party to discontinue the work and descend into the valley, there being no place nearer which could afford shelter.

May 7.—Owing to the continuance of the storm an attempt to proceed to the mountain and resume work was impossible.

May 8.—The storm having broken, started up the mountain in the morning, arrivin at 3 p. m.; found the rain-gauge overflowing, which indicated a fall of over 4 inche during 48 hours.

May 9.—Fair weather, but having no place to expose the instruments made no observations.

May 10.—A log-cabin being so far finished to put the instruments in their place by 6 p. m., commenced work at 7 a. m.

The instruments are placed on the north side of the building as follows:

Elevation of the cistern of the barometer, (No. 185,) 3 feet 10 inches above th ground.

Elevation of the bulb of the thermometer, (No. 145,) 4 feet 5 inches above the ground

Elevation of the bulb of the hygrometer, (No. 181,) 4 feet 5 inches above the ground

Elevation of the anemometer, (No. 42,) 13 feet 4 inches above the ground.

Elevation of the anemoscope, 13 feet above the ground.

Elevation of the rain-gauge, 2 feet 6 inches above the ground.

The ground being a solid bed of rocks, made it impossible to have the gauge at th same level with the ground. A thunder-storm, with heavy rain and hail, passed ove this mountain at 6.30 p. m., advancing from southwest to northeast. Light rain wit brisk west wind during the remainder of the day. Rain-fall ceased at 11.18 p. m. total amount .61 inch. Dense fog at midnight.

May 11.—A dense fog, with fresh and brisk west and northwest wind, prevailed unti a few minutes after 10 a. m., when the weather became partly cloudy and fair, bu with still fresh and brisk northwest wind. A halo from 7.30 p. m. until 11.18 p. m Temperature declining slowly but steadily.

May 12.—Cloudy in the early morning, with light fog in the valley; wind continues brisk from the northwest. Dense fog from 4 a. m. until shortly after 6 a. m.; heavy frost. Fair weather and increasing temperature until 6 p. m. A distant and apparently very heavy thunder-storm west of this station, moving from northwest to southeast at 7.08. A heavy thunder-storm passed over this place, with heavy rain, from west to east, at 7.40, wind backing to west, and increasing to high. Fair weather, with light fog in the valley, from 8.32 p. m. until 10 p. m., when a light rain commenced to fall; clearing at midnight. Total amount of rain-fall during the day .45 inch. Halo from 8.45 until 10.16 p. m.

May 13.—Fair weather, with high and very high north and northwest winds, until noon; sky covered partly with cirrus clouds, the wind blowing steadily and variable from west and southwest, moderated until 8 p. m. to fresh with continuous fair weather. From shortly after 8 p. m. the force of the wind increased to high and brisk and backing to northwest. Weather cloudy.

May 14.—Partly cloudy and foggy in the morning, with brisk west wind. Light rain of but short duration at intervals during the entire day. Weather generally foggy and cloudy, and for a few hours only before midnight, fair. Wind very variable, backing to southwest, south, and southeast, and as far as due east. Total amount of rain-fall. .11 inch.

May 15.—Foggy weather with fresh southeast wind blowing steadily until 7.28 a. m., when it backed to east. Rain commenced to fall at 6.10 a. m. and continued until 4.45 p. m. The wind backed then to northwest and west and veering to north, being light and fresh but very variable. Dense fog prevailed throughout the remainder of the day. Total amount of rain-fall, .47 inch.

May 16.—Very foggy weather, with fresh variable north and northwest wind, until 7.33 a. m.; wind veering to northeast, backing again to northwest and west, and moderating to gentle during the forenoon. Generally fair weather, with light fog in the valley during the forenoon. At 9 a. m. well-defined cumulus clouds were visible far below this station. Cloudy weather with variable westerly and northerly winds during the afternoon and earlier part of the night. Fair weather, and for a short time perfectly clear weather, (at 10.39 p. m.,) until midnight.

May 17.—Fair weather, with brisk but variable northwest and west winds, in the early morning. Wind moderated to gentle and fresh during the day, and after backing in succession to southwest, south, and southeast, continued so until midnight. Fair weather with rising temperature continued until after 8 p. m. The lower atmosphere during the whole time very hazy. Cloudy until nearly midnight; fair at midnight.

May 18.—Foggy and cloudy weather, with fresh and brisk steady southeast wind, until 6.27 a. m., when the wind veered to the west and moderating in force. Cloudy weather during the forenoon and afternoon. Toward night the wind backed to south and southwest and increased to brisk. A light rain fell for a short time at 6.15 p. m. Foggy during the remainder of the day. Total amount of rain-fall, .01 inch.

May 19.—Foggy and cloudy weather, with brisk and high variable southwest wind, in the morning. The wind moderated in violence after veering to west, toward noon. Cloudy during the forenoon and afternoon, with wind backing to southwest and increasing to brisk. A distant thunder-storm passed east of this station at 1.15 p. m., moving from the southwest to the northeast. A light rain commenced to fall at 1.34 p. m., which was for 12 minutes accompanied by hail of considerable size, and continued until 2.32 p. m. Cloudy and threatening during the evening. Fair at midnight. Brilliant heat-lightning during the last three hours of the day, at first west and afterward north and northeast of this station, illuminating sometimes the entire heavens. Total amount of rain-fall, .30 inch.

May 20.—Fair weather, with high southwest wind in the earlier part of the day. Heat-lightning continued on the southwest horizon. Foggy, with fresh west winds, until 8.40 a. m. Fair and cloudy, with gentle but steady northwest wind, until noon. A phenomenon of peculiar nature occurred here during the latter part of the forenoon. The range of mountains of which Mount Mitchell is a part, divided the lower part of the atmosphere in two distinct halves. On the western side of this range the atmosphere was filled with haze, while the eastern side was foggy, and this fog was at times of considerable density. The line where fog and haze met was remarkably well defined and seemed to be unchangeable until shortly after 1 p. m., when a pretty dense fog filled the entire atmosphere. Foggy weather and light rain during the afternoon, with variable gentle and fresh easterly winds. A thunder-storm with heavy rain passed over this station at 4.20 p. m., moving from south to north. Cloudy and rainy weather, with brisk southeast wind, until midnight. Total amount of rain-fall, .56 inch.

May 21.—Foggy weather in the earlier morning, with brisk but variable southeast to east winds. Light rain commenced at 2.18 a. m., and ended at 6.45 a. m. Foggy until 9.52 a. m., when again it commenced to rain, ending at 10.24 a. m. Heavy rain from 12.20 p. m. until 1.25 p. m. Wind veering to southwest, and increasing to brisk, after being fresh and gentle, at 4.30 p. m. Dense fog filled the atmosphere, and a light, drizzling rain fell at 3.10 p. m., and continued until 9.28 p. m. Temperature rather low for the season, and varying but little during the entire day. Cloudy and foggy until midnight. Total amount of rain-fall, .85 inch.

May 22.—Light rain at 12.23 a. m. until 1.45 a. m., with brisk variable southwest and west winds. Foggy weather until 5.40 a. m., when it commenced to rain, and continued until 7.01 a. m. A distant thunder-storm passed south of this station at 4 a. m., wind veering to west and northwest during the forenoon, moderating to gentle and fresh, with cloudy weather, which became fair during the afternoon. At 6.50 p. m. the wind veered to northeast, and weather continued fair. Toward midnight the weather was clear. Temperature rising slowly but steadily. Total amount of rain-fall, .21 inch.

May 23.—Fair weather with variable fresh and brisk westerly winds. From 5 a. m. until 8 a. m. foggy. Light rain commenced at 8.32 a. m., and ended 8.50 a. m. Fair weather with fresh and brisk north and northwest wind until midnight. During the latter part of the forenoon well-defined cumulus clouds were at a considerable distance below this station. Brilliant heat-lightning during the evening continued until midnight, first on the eastern and southern horizon, afterward on the southern and western horizon, and, finally, on the western horizon only. Temperature rising slowly throughout the day. Total amount of rain-fall, .05 inch.

May 24.—Foggy at the beginning of the day, with brisk westerly winds. Cloudy and fair weather with fresh west and northwest winds until 3.45 p. m., from which time the weather continued fair until midnight. The wind, after veering to north and northeast, and increasing to very brisk, and moderating only a few hours before midnight, very variable during the entire day. Heat-lightning of short duration at 9 p. m. on western horizon.

May 25.—Fair weather, with brisk and fresh northeast and east winds, until 10.40 a. m., when the whole sky was covered with heavy cumulus clouds. A thunder-storm with heavy rain and hail, the size of which was fully equal and for a few minutes exceeded that of the largest kind of buckshot during the time of its fall, (20 minutes,) passed over this station at 11.40 a. m., moving from southeast toward northwest. During its passage the wind had every possible direction, veering and backing to and from every point in the compass in rapid succession until at 12.40 p. m. the wind veered to east again, by which time the storm had passed. Cloudy weather with very variable but fresh and light northeast and southeast winds during the afternoon. Distant thunder-storms in southwest and east, the former moving from northwest to southeast, the latter from northeast to southwest at 4 p. m., and at 5 p. m. thunder-storms in southwest and west direction of this station. Fair weather from 9.10 p. m. until 11.25 p. m., when a dense fog filled the atmosphere. Temperature declining. Total amount of rain-fall, .47 inch.

May 26.—Foggy weather, with steady, fresh and brisk southeast wind in the early morning, until 7.25 a. m., when a heavy rain with fresh southwest wind commenced to fall, ending at 9.10 a. m. Cloudy and foggy weather with wind backing and veering from southwest to southeast until noon, when in short succession two thunder-storms passed this station, both moving from southwest to northeast. Cloudy and foggy weather until the close of the day with fresh and brisk southerly and easterly winds. During the afternoon a distant thunder-storm passed north, and shortly afterwards another southwest of this station, both moving in a direction from southeast toward northwest. Between the hours of 3 p. m. and 4.30 p. m., heavy and well-defined cumulus clouds were in the valleys east and southwest of this station, nearly 500 feet below the summit of Mount Mitchell. Temperature slightly rising. Total amount of rain-fall, .42 inch.

May 27.—Foggy weather, with variable and brisk southwest wind, until 4.30 a. m. Fair, with brisk westerly winds, which toward noon moderated to gentle, during the entire forenoon. During this time heavy cumulus clouds were filling the valleys below this station, varying from 200 to 500 feet below. A heavy thunder-storm advancing from the southwest to the northeast passed with heavy rain and very large hail (the latter continued to fall for five minutes) over this station. The wind's force increased after the passage of this storm from gentle to high, moderating only for a brief period at midnight to brisk. Weather cloudy in the evening and fair until midnight. Temperature slightly falling. Total amount of rain-fall, .52 inch.

May 28.—Clear weather, with very brisk southwest wind, until a few minutes after 2 a. m., when the sky became overcast with cumulus clouds. Light rain soon began to fall from 3.30 a. m. until 4.45 a. m. The wind, after veering to west, and shortly afterward to northwest, moderated to fresh. Fair weather until noon. Small cumulus clouds in the valleys below this station during the greater part of the morning and forenoon. Cloudy weather, which, for only two short hours, from 8.16 p. m. to 10 p. m., was cleared to fair, prevailed until midnight. Westerly and northwesterly winds, fresh and gentle, steady in the fore part of the afternoon, and variable until midnight. A light rain-shower passed over this station from 5.40 p. m. until 5.55 p. m; temperature slightly increasing. Total amount of rain-fall, .04 inch.

May 29.—Cloudy weather with fresh northwest wind at the beginning of the day.

At 1.55 a. m. light rain commenced to fall, and continued until 10.15 a. m. After the rain had changed from light to heavy, by 8 a. m., the wind, very variable, backed from northwest to southwest, veered to southeast, and backed again to west during the forenoon, and increased at 9 a. m. to brisk, but moderated at noon to fresh; cloudy weather, with very variable westerly winds, during the afternoon and evening. From 2.55 until 3.10 a light rain-fall. Heavy cumulus clouds in the valleys east and south of this station, whose upper limits sometimes on a level with this station, sometimes a trifle higher, and sometimes as much as 200 feet below this station. Foggy weather, with fresh but steady southwest wind, until shortly before midnight, when the fog disappeared and the weather became cloudy; temperature slightly falling. Total amount of rain-fall, 1.21 inch.

May 30.—Cloudy and foggy weather from beginning of the day until noon, with fresh and brisk westerly winds. A light rain fell from 2.25 a. m. until 2.40 a. m. Foggy and cloudy, with at first variable northerly winds, which, by 5 p. m., became a steady northeast wind until midnight. Heavy thunder-storms passed at noon north and west of this station, and in the earlier part of the afternoon northeast of this station. Heavy and afterward light rain from 3.20 p. m. until 5.20 p. m. At midnight the weather was fair; temperature falling. Total amount of rain-fall, .36 inch.

May 31.—Foggy weather, with fresh and brisk northeast wind, which, until shortly after 7 p. m., was steady and variable until midnight. Light rain from 6.40 a. m until 8.45 a. m. The dense fog which prevailed on this station throughout the entire day disappeared for only a few minutes at 1 p. m. Temperature very low for the season. Total amount of rain-fall, .17 inch.

MONTHLY SUMMARY.

Mean temperature from May 11 to May 31	49°.3
Rain-fall from May 10, 6 p. m., to May 31	6.81 in.
Number of rainy days from May 10, 6 p. m., to May 31	17
Prevailing winds from May 10, 6 p. m., to May 31	N. and W.
Number of miles traveled from May 10, 6 p. m., to May 31	6,508

The cabin is built immediately on the peak, which is a flat, rugged place, about 80 feet long and 40 wide. It stands exactly north and south; is 16 by 14 feet; has a window in each end, and the door is on the west side, the chimney on the east. The thermometer and hygrometer are in a shelter built over the north window. The barometer hangs on the east side of the window, next to which stands the self-registering attachment to the anemometer. The anemometer is placed on the north end of the roof, and a few feet from it is placed the vane. The rain-gauge is placed on the ground to the southwest of the cabin some 40 feet, and has a full exposure. Instruments all in good condition.

Respectfully submitted.

Journal abstract from June 1 *to June* 30, 1873.

MOUNT MITCHELL, NORTH CAROLINA.

June 1, 1873.—Foggy weather, with variable brisk east wind at the beginning of the day. Fair weather, with steady northeast wind, which, until 6 p. m., was light and gentle, and afterward became brisk, until midnight. Cloudy, foggy, and fair weather until midnight. Temperature rising. Between 6 p. m. and 8 p. m. the thermometer fell considerably, but rose slowly until midnight.

June 2.—Fair and clear weather, with variable brisk east wind at the beginning of the day. From 4 a. m. the wind moderated to fresh, and continued so until shortly after 7 p. m., with partly fair and foggy weather and increasing temperature. Toward night the fog became more dense, and light only for a brief time, at 10 p. m, with wind increasing to brisk and veering to northeast, but backing toward midnight to southeast, by which time its force moderated to fresh. Light rain commenced to fall from 11.15 p. m., lasting until midnight. Total amount of rain-fall during the day, .04 inch.

June 3.—Light rain continued until 1.43 a. m. Foggy weather, with very variable easterly winds, which, until 3 p. m., were fresh, increasing to brisk until after 9 p. m., when they moderated to fresh again, throughout the day. Heavy rain commenced at 9.15 p. m., becoming light at 10.20 p. m., but heavy again until midnight. The wind became, by 7 p. m., a steady east one, and continued so until the close of the day Temperature falling. Total amount of rain-fall during the day, .53 inch.

June 4.—Rainy weather, with variable fresh and brisk south and southwest winds continued until 5.10 a. m., the rain being partly heavy, partly light. Foggy and cloud weather, with fresh southwest wind, which during this time was steady until noon interrupted only for 25 minutes by light rain at 11.20 a. m. Foggy and cloudy weather with variable fresh southerly and westerly winds, until 3.10 p. m., when a light rai fell until 4.30 p. m., during the afternoon. Fair weather from 6.40 p. m. to 8.25 p. m with variable brisk westerly winds. Foggy until midnight. Heat-lightning on wes and northwest horizon at 8 p. m. Temperature slightly increasing. Total amount o rain-fall during the day .60 inch.

June 5.—A very dense fog, with very brisk westerly winds and interrupted only onc by a light rain-shower at 2.15 a. m., prevailed on this station until noon. Foggy an rainy weather until midnight. A very heavy rain, the heaviest experienced so far a this place, fell from 6.08 p. m. until 7.05 p. m., the depth of which amounted to .4 inch. Wind continued variable and brisk, westerly; temperature falling. Tota amount of rain-fall during the day, .83 inch.

June 6.—Rainy weather continued, with brisk and fresh variable northwest and wes winds, until 12.00 p. m.; foggy weather, with variable northwest and north wind, unti midnight, by which time the wind's force had greatly moderated. A light rain-showe in the afternoon from 4.22 p. m. until 4.48 p. m.; temperature still falling. Tota amount of rain-fall during the day, .48 inch.

June 7.—Fair weather, with fresh north wind, in the early morning. The wind bein variable backed shortly after 2 a. m. to northwest. As soon as the wind backed, th atmosphere was filled with fog, at first somewhat pretty dense, afterward light, an lasted so until 5.20 a. m. when the weather became fair. Shortly before noon and fo three hours in the afternoon the weather was cloudy, but continued fair from 3.10 p m. until midnight. The variable north and northwest wind moderated in force greatly being gentle from 10 p. m. and backing to south and southwest by midnight. Temperature slowly rising.

June 8.—Fair weather, with gentle but variable southeast wind, until 3.30 a. m., whe the weather became clear and remained so for a little more than two hours. Generally fair until 9.20 a. m., with gentle and light southeast and east winds. By 9.20 a m. the wind veered to south and toward noon to southwest and the sky became covered with heavy cumulus clouds moving from the west. The weather continued cloudy until 2.45. p. m., and then became foggy, remaining so until midnight. At 2.45 p. m the wind backed suddenly to the east, increasing at the same time from fresh to brisk The temperature which, until 2.45 p. m. was steadily but slowly increasing, fell rathe rapidly until the close of the day. Light rain-shower from 8.10 p. m. to 8.49 p. m. A drizzling rain commenced at 11.25 p. m. and lasted until midnight. Total amount o rain-fall during the day, .05 inch.

June 9.—The light, drizzling rain continued until 1.41 a. m., the wind being variable, brisk east wind, moderated at 4.30 a. m. to fresh, and veered to south. Thermometer continued to fall until after 4 a. m. Weather foggy until after 5 p. m. The wind after veering to southwest by 7 a. m. and to west at 9.45 a. m., became light. At 4 p. m. the wind veered to northwest and a calm ensued from a little before 7 p. m. unti shortly after 8 p. m. Afterward a gentle northwest wind sprung up, backing shortl to west and southwest, and increasing to fresh by midnight. Cloudy weather from 5.25 p. m. until 11.40 p. m., when a pretty dense fog enveloped this peak. The temperature, which had been slowly rising during the day, fell again toward midnight. Tota amount of rain-fall during the day .09 inch.

June 10.—Cloudy weather, with light and gentle variable and steady southwest win and very slowly rising temperature, until noon. Light rain-showers from 8.05 a. m until 8.40 a. m. and from 10.50 a. m. until 10.55 a. m. Cloudy weather, interrupted fo a short time by a dense fog at 3 p. m. and fair weather from 4.40 p. m., until 7.10 p. m. prevailed throughout the remainder of the day. Light rain from 12.25 p. m. until 12.4 p. m. The wind increased shortly after noon to fresh and brisk, and after 9 p. m. to high and remained so; a variable southwest wind until midnight. The temperature, whic until 2 p. m. was rising, began to fall rapidly until 8 p. m., continuing steady, but lo for the season, until the close of the day. Total amount of rain-fall during the day .08 inch.

June 11.—The high variable southwest wind of the previous day continued unti after 1 a. m., when it moderated to brisk and veered to west by 4.20 a. m. Cloud weather, until after 3 a. m., interrupted, from 1.25 a. m. to 1.38 a. m., by light rain. Fogg from after 3 a.m. until 4.07 a. m., when a light rain commenced to fall, ending at 8.4 a.m. Foggy weather afterward, until 11.35 a. m., when again a light rain commenced by this time the brisk west wind had backed to southwest, and moderated to fresh, remaining so until 6 p. m., but veering to west at 2.40 p. m., at the exact time the rai ceased, and, toward 5 p. m., to northwest, and backing shortly before 6 p. m. to southwest. Foggy weather, with brisk southwest and west wind until 7.35 p. m., when ght drizzling rain commenced to fall, not ceasing at midnight. At midnight the wind ad veered to west. and moderated to fresh. Temperature low for the season. Total mount of rain-fall during the day, .61 inch.

June 12.—The drizzling rain of the previous day ended at 12.40 a. m. The weather hen became foggy, and continued so until noon, with the exception of a light rain rom 4.05 a. m. until 4.25 a. m., and a very light fog at 11 a. m., disclosing the sky covred with cumulus clouds. The wind continued to be a very variable westerly wind, nostly fresh, until 9.45 a. m., when it veered to northeast, and, after blowing from this oint for about two hours, veered suddenly to the south, but backed by 1 p. m. again to ortheast; at 4.20 p. m. the wind veered to east, and continued a fresh variable east wind ntil midnight. During the afternoon the weather was at first cloudy, afterward oggy; and, by 4.18 p. m., rainy, and continued so until midnight. Temperature low nd slightly falling toward night. Total amount of rain-fall during the day, .55 inch.

June 13.—The weather was, after the drizzling rain ended at 12.10 a. m., foggy until .25 a. m., when the somewhat dense fog disappeared, leaving a very light fog only, and isclosing the sky partly covered with cumulus clouds. By 7 a. m. the fog became lenser, and, hiding everything from view, remained so until the close of the day, dislosing only once, at 6 p. m., during the entire time a great part of the sky. Toward nidnight the fog was very dense. The wind, during the entire day, was very variable. The fresh northeast wind, after moderating in force, backed, at 4.15 a. m., to west, and, noderating to light, veered, at 7 a. m., again to northeast, but backed, by 8 a. m., to orth; by 11 a. m., to northwest, and, before noon, to west, after which time it veered o northwest, and continued, until 5.40 p. m., when, after increasing to gentle, the wind acked to southwest, and, increasing still more to fresh, backed, shortly after 9 p. m., to ast, remaining so until midnight. Temperature slightly increasing.

June 14.—Foggy weather, with fresh southeast wind, from the beginning of the day ntil 1.35 a. m., when the wind veered to southwest and a light rain began to fall, ending at 2.40 a. m., from which time the weather continued foggy until 11.15 a. m. The og toward noon became very dense. The variable southwest wind increasing in the arly morning to brisk, but moderating by 7 a. m. to fresh, backed soon to south, and hortly afterward to southeast. At 11.15 a. m. a heavy rain commenced and continued, artly heavy, partly light rain, until 6.15 p. m. At the same time the rain commenced o fall the wind backed to east, but veered to southeast and southwest in short sucession, and backed again to east by 4.30 p. m. At ten minutes before 6 p. m. the wind eered to southwest, and at 9.15 p. m. to west, remaining so. A very variable fresh nd gentle wind until midnight. After the rain ceased to fall the fog cleared for a hort space of time, disclosing the sky, covered with cumulus clouds, and the valleys urrounding this peak filled with heavy cumulus clouds, whose upper limits were pparently from 500 to 800 feet below this station. Partly foggy and fair weather ntil midnight. Temperature slightly diminishing. Total amount of rain-fall during he day, .89 inch.

June 15.—Fair and foggy weather, with brisk and variable northwest wind, until oon, by which time the wind's force had moderated to fresh. At 1 p. m. the fog gradually disappeared, disclosing the sky, covered with heavy cumulus clouds. The weather became cloudy, and continued so until nearly 7 p. m., when it cleared to fair, and continued so until midnight. The variable fresh northwest wind became at the ame time a steady northwest wind, and moderated to gentle by midnight. Temperature slightly increasing.

June 16.—Generally fair weather with variable fresh westerly winds, which at 3.40 a. m veered to northeast, but backed to northwest again, after moderating to gentle and light, at 10.25 a. m. At the same time the weather became cloudy, and continued so until midnight, only once, at 6 p. m., clearing to fair for a few minutes. The wind being mostly light and gentle was a variable westerly, when at 8 p. m. it became a steady west wind, and after veering at 10.30 p. m. to northwest, a steady northwest wind, remaining so until the close of the day. The temperature during the entire day was considerably rising.

June 17.—Cloudy weather continued until 5.20 a. m., when it became fair until 9.40 a. m., by which time the sky again was covered with cumulus clouds, continuing so until 4 p. m. · At 4 p. m. the cumulus clouds greatly disappeared, leaving the weather fair, but for two hours only, when the sky was entirely clouded over. At 6.50 p. m. this peak was enveloped in fog, remaining so until midnight. The steady northwest wind veered by 4 a. m. to northeast, becoming variable, and after moderating from fresh to light, veered by 9 a. m. to south, by 11 a. m. to southwest, and at noon to northwest. Shortly after noon, after the wind had veered still farther to north, and backed again to northwest, its force increased to gentle, and backing to west increased to fresh. At 7 p. m. the wind had veered to northwest, but backed at 8.35 p. m. to southwest, and after increasing to brisk remained a variable brisk southwest until midnight. A distant thunder-storm passed at 12.10 p. m. southeast of this station, moving from southwest to northeast. Heat-lightning from 8 p. m. until 10 p. m. northeast of this station, and apparently very close by. Temperature rising.

June 18.—Foggy weather at the beginning of the day, which, after the fog had di appeared, nearly, at 1.20 a. m., became fair, and continued so until shortly after 3 a. m when the weather became, for about 30 minutes, cloudy, and foggy afterwards. B 9.15 a. m. the fog disappeared, leaving the weather fair, but for a short time only, b coming at 2 p. m. cloudy and threatening. Light rain began to fall from 2.15 m. until 4.25 p. m., after which time the weather was generally foggy until midnigh with the exception of only a short time, at 6 p. m., when it was cloudy. Variable bris and fresh westerly winds prevailed during the entire day. A heavy thunder-stor passed southwest of this station, moving from west to east, at 2 p. m. Temperatu slightly falling. Total amount of rain-fall during the day, .14 inch.

June 19.—Foggy weather, with variable brisk northwest and west winds, until 10. a. m., when, after the weather was for not fully one hour fair, it became cloudy, an continued so until 2.15 p. m. At this time light rain began to fall, ending at 2.45 m. The wind had by this time moderated to fresh, and was a variable west win Foggy and rainy weather until midnight. The wind at 7.45 p. m. increased to bris and high, being a variable northwest and west wind, and continued so until midnigh At 2 p. m. a heavy thunder-storm passed southwest of this station, moving from we to east. Temperature steady. Total amount of rain-fall during the day, .15 inch.

June 20.—Light rain and foggy, with brisk and high west winds, until 4.18 a. m., whe the rain ended. Foggy weather, with variable brisk west wind, until 8.10 a. m., whe the wind veered to northwest, but backed shortly afterward to west, and a heavy ra began to fall, ending at 1.15 p. m. The weather then became foggy and remained until midnight, with the exception of the time from 3.15 p. m. to 3.50 p. m., when light rain fell. The wind continued to be a variable west wind until 8.25 p. m., vee ing then to northwest, and, moderating slightly in force, remained so until midnigh Temperature nearly uniform throughout the entire day. Total amount of rain-fa during the day, 1.50 inch; the heaviest fall during twenty-four hours so far recorde

June 21.—Foggy weather, with brisk variable northwest wind, prevailed until 6. a. m. The fog now disappeared, and the weather became fair, remaining so until 1. p. m., when the sky became overcast with cumulus clouds, which again cleared aw at 6.45 p. m. Fair weather from 6.45 p. m. until midnight. At 8.15 a. m. the variab northwest wind veered to northeast and moderated to fresh, but backed by 10 a. to north, and having become a gentle wind, continued a variable northerly to wes erly wind until 8.10 p. m., when, after increasing to fresh, the wind was a variab southwest wind, remaining so until midnight. Heat-lightning on southern horizon 10 p. m. Temperature slightly rising.

June 22.—Fair weather, with fresh variable westerly winds, which by 7 a. m. mode ated to light, prevailed until 9.40 a. m. followed by cloudy weather, which continue until 5.41 p. m., with the exception of the time from 2.30 p. m. to 2.55 p. m., during t passage of a thunder-storm moving from west to east, with heavy rain and a sma amount of hail. Light rain began to fall at 5.41 p. m., ending at 7.14 p. m. T weather then became cloudy until 9.18 p. m., and partly fair and foggy until midnigh The light variable westerly wind veered at 12.10 p. m. to northeast, and at 2.30 p. to east, increasing in the mean time to gentle, and after backing to southwest at 3. p. m. and increasing to fresh, continued a variable southwest wind until midnigh From 2 p. m. until shortly after 4 p. m. this peak was completely surrounded by thu der-storms, of which only one passed over it, at 2.30 p. m. Heat-lightning southea of this station at 8 p. m. Temperature steady. Total amount of rain-fall during t day, .29 inch.

June 23.—Foggy weather from the beginning of the day until 2.50 a. m., when f nearly one hour the weather became fair, and cloudy afterwards. At 5.48 a. m. t weather had cleared to fair, and continued so until after 9 a. m., when it became aga cloudy and threatening at noon. A heavy rain fell from 12.04 p. m. until 12.21 p. Cloudy weather then prevailed until 5.35 p. m., when a thunder-storm, advancing fro northeast to southwest, passed this station, with heavy and light rain from 5.35 p. to 7.14 p. m. Light rain again began to fall at 9 p. m., ending at 11.05 p. m., from whi time until midnight the weather cleared to fair. Variable fresh westerly winds pr vailed until 7 a. m., when they moderated to gentle, and to light at noon. At 2.20 m. the wind backed to east, and, after increasing to fresh, veered at 4 p. m. to sout west, at 4.30 p. m. to northwest, and at 9 p. m. to northeast, and, after moderating gentle and light, continued so until midnight. Several thunder-storms passed by th station, one at 11 a. m. in the northwest, another at 1 p. m. in the east, moving fro south to north. Two thunder-storms at the same time were seen, at 4.14 p. m., in t northwest and west. During the passage of the thunder-storm over this station t temperature fell very rapidly, but rose again slowly toward midnight. Heat-lig ning in the northeast at 9 p. m., and in the south from 9 p. m. until midnight. To amount of rain-fall during the day, .41 inch.

June 24.—The day began with fair weather until 5.40 a. m. Foggy, and shortly aft ward cloudy, until 7.25 a. m. Fair weather then continued until noon. During t afternoon, until 6.15 p. m., the weather was cloudy and threatening; at 3 p.

vo distant heavy thunder-storms passed by this station. One thunder-storm as in the south, moving from southwest to northeast; and the second, at the same me, in the northeast, moving from north to south. A third distant thunder-storm assed by at 3.25 p. m., moving from west to east. At 7 p. m. the weather had cleared fair, and by 9 p. m. this peak was shrouded in fog, which continued until midnight. he wind was, during the entire day, very variable. A gentle northeast wind veered, 1.15 a. m., to southwest, and, after increasing to fresh, continued a variable northwest nd west wind until 9.10 a. m., which by 10 a. m. had veered to west, and by 11 a. m. northeast. From after 11 a. m. until after 4 p. m. a light northerly wind prevailed, nd, after increasing to fresh, continued a north to northwest wind until midnight. emperature increasing slightly.

June 25.—Foggy and fair weather, with variable fresh and gentle northwest to northast winds, prevailed until 10.40 a. m.; the weather became cloudy and threateng at 4.14 p. m. At 4.20 p. m. a heavy rain began to fall, moderating by 5 p. m. to ght, and ending at 5.32 p. m. Light rain again began to fall at 6.40 p. m., with wind eering to east, and continued until midnight. Temperature high and rising until 2 m., but declined very rapidly toward night. Total amount of rain-fall during the ay, .78 inch.

June 26.—Light rain ended at 12.38 a. m. Foggy weather afterward until 3.50 a. m., om which time cloudy weather continued until 8.10 a. m. Foggy weather then preailed until 9.11 p. m., when a light drizzling rain commenced to fall, and continued ntil the close of the day. Fresh, steady, and variable east wind prevailed until after a. m., moderating then to light, and backing shortly afterward to northwest. By 1 m. the wind veered to north, and at 1.25 p. m. to northeast. After increasing to esh the wind veered, at 4 p. m., to east, and increasing to brisk shortly after 6 p. m., ut moderating to fresh again after 8 p. m., veered, at 10.30 p. m., to southeast, and ontinued so until midnight. Temperature falling. Total amount of rain-fall during e day, .23 inch.

June 27.—The light drizzling rain of the previous day ended at 3.25 a. m. Cloudy eather afterward until 5.15 a. m. At 5.15 a. m. a thick fog surrounded this station, nd remained so until midnight, only diminishing in density during the afternoon and ight. The fresh southeast wind veered by 3 a. m. to south, and shortly after to southest, and after becoming gentle during the forenoon and light from 1 p. m. until 4.14 m., remained, after increasing to fresh toward night, a partly steady, partly variable outhwest wind until midnight. Temperature steady, but rather low. Total amount f rain-fall during the day, .13 inch.

June 28.—Foggy weather, with fresh variable southwest wind, which at 7.49 a. m. eered to west, prevailed until 1.25 p. m. The fog then suddenly disappeared, disclosng the sky covered entirely with heavy cumulus clouds, but shortly after 3 p. m. fog gain surrounded this peak and continued the remainder of the day, the time from 6.20 m. to 8.17 p. m. excepted, during which a light rain fell. By 1 p. m. the wind had oderated to gentle, and had become a steady west wind, but after increasing to fresh t 5.45 p. m. was variable. After 10 p. m. the wind veered to northwest and, moderaing to gentle, continued so until midnight. Temperature slowly rising. Total mount of rain-fall during the day, .15 inch.

June 29.—Foggy and rainy weather throughout the day, but rainy chiefly during the fternoon and evening. The wind until 2.50 p. m. was a variable, fresh, and gentle est to southwest wind. At 2.50 p. m. the wind backed to south, and shortly before 5 m. to southeast, remaining so until midnight. Temperature rising slowly. Total mount of rain-fall during the day, .59 inch.

June 30.—Foggy and rainy weather, with falling temperature, continued throughout he day, the rain being partly heavy, partly light rain. Variable fresh and brisk southast to east winds prevailed until noon, when the wind veered to southwest, and hortly afterward to west. At 3.45 p. m. the wind again veered to northwest and remained fresh and brisk until midnight. Total amount of rain-fall during to-day, .95 ch.

Abstract of daily journal kept on the summit of Mount Mitchell, North Carolina, from Ju 1 *to July* 31, 1873.

July 1.—Foggy weather continued, with brisk, variable westerly wind, until 9.40 a. n when the fog disappeared and fair weather ensued, remaining so until after 2 p. m.; clouc from 3 p. m. until 6 p. m. By 7 p. m. the weather was fair again, and clear by 10 p. n remaining clear until midnight. By 12 m. the brisk northwesterly wind had moderat to fresh, and backed after 5 p. m. to westerly, and by 8 p. m. to southwesterly, increa ing to brisk in the mean time and remaining so until midnight. Temperature risi during the day, but falling toward night.

July 2.—Clear weather until 2.10 a. m., when fair weather followed, and continu until noon; cloudy until 4.30 p. m.; fair weather then prevailed the remainder of t day. Variable, brisk southwesterly wind prevailed until 6 a. m. The wind moderat to fresh after 6 a. m. and veered to west and northwest, and becoming gentle, back at 2.20 p. m. to southwest, and continued, after increasing to fresh and to brisk at 11. p. m., until midnight. Three distant thunder-storms passed by the station, one at 2. m., northeast of the station, moving from east to west, another at 2.40 p. m. in the ea moving from northeast to southwest, and the third at 4.05 p. m. in the northwe moving from south to north. Temperature rising throughout the day.

July 3.—Generally fair weather with steady, high temperature, and variable nort westerly to southwesterly winds, which in the earlier part of the day were brisk a fresh, but moderated to gentle and light at noon, and increased to fresh toward nigh prevailed during the day.

July 4.—Fair and foggy weather, with fresh westerly winds, until noon. The wi calmed for a brief period at noon and the weather became cloudy; generally f weather, with variable fresh and brisk westerly winds, until midnight. Heat-ligh ning from 10.10 p. m. until midnight. Temperature high and rising.

July 5.—Foggy at the beginning of the day. A heavy thunder-storm, with hea rain, passed, with northwesterly wind, increasing to brisk and rapidly-falling tempe ature over this station at from 1.35 a. m. to 2.20 a. m., moving from northeast to sout west. Generally foggy, with variable brisk northwesterly wind, until noon. second thunder-storm, with heavy rain and a small amount of large hail, passed ov at from 2.34 p. m. to 3.40 p. m., advancing from north to south. Light rain and fog weather, with variable brisk northerly winds, prevailed until midnight. Tot amount of rain-fall during the day, 1.07 inches. Distant thunder-storms passed by th station at 2 p. m., one in the north and the other in the northwest.

July 6.—Foggy weather, with variable brisk northwesterly wind, until 9.15 a. m fair the remainder of the day. The wind, after moderating to fresh, veered at 4 p. to north and at 5.40 p. m. to northeast, increasing in the mean time to brisk again, b moderated to light toward midnight, after becoming a steady northeast wind. Te perature rising very slowly.

July 7.—Generally fair weather, with variable light and gentle northerly wind until 6.35 p. m. Foggy weather, with wind backing to southwesterly and increasi to fresh and brisk, until midnight. Temperature rising slowly.

July 8.—Brisk southwesterly wind and dense fog, with light rain at 6 a. m., until a. m., when wind veered to northwest. Cloudy at noon. Foggy weather prevaile with brisk and fresh northwesterly wind, until midnight. Temperature falling co siderably. Total amount of rain-fall during the day, .03 inch.

July 9.—Wind veered to northeast at 2 a. m., with fair weather. Heavy cumul clouds in the valleys below from 4 a. m. to 6 a. m. At 8.20 a. m. the wind, havi moderated to light, veered to southeast, and calmed entirely at 10 a. m., but soon ro again and backed to northwest, remaining so until 2.45 p. m., when it veered to nort east and east, increasing in the mean time to fresh. Generally cloudy weather fro 8.20 a. m. until 7.30 p. m., when fog settled upon the mountains. Light rain from 10.25 m. to 10.45 p. m. Temperature rising slowly. Total amount of rain-fall during t day, .02 inch.

July 10.—Easterly winds with light rain until 1.35 a. m.; shortly after 2 a. m. t wind veered to southwest, and the fog raised about 3 a. m., but settled again at 5 m. and remained until 10 a. m.; heavy rain at 11.45 a. m. Wind veered during the a ternoon, with light showers, from southwest to south and to west, towards midnig increasing to brisk. Distant thunder-storms at 5 p. m. in south and southwest; hea lightning in south and southeast horizon at 10 p. m. Fair weather from 8.38 p. m. un midnight. Temperature declining slightly. Total amount of rain-fall during the d .50 inch.

July 11.—Foggy weather with brisk and steady westerly wind, until 5.40 a. m., whe the wind veered to northwest and moderated to gentle; fair weather until noon; cloud weather, with light northwesterly wind, until 6.25 p. m.; a calm occurred at 5 p. m.; 6.25 p. m. the wind veered to northeast, and shortly afterward to east, increasing to fres and continued with foggy weather until midnight. Temperature rising.

July 12.—Foggy and cloudy weather until 3.40 a. m.; fair until 6.10 a. m., when fo settled again; light rain from 8.50 until 10.10 a. m.; steady, brisk, and fresh easterly wind until 11.45 a. m., when wind veered to southeast; partly fair and cloudy weather until 6.30 p. m.; foggy with variable, brisk and fresh easterly wind until midnight. Temperature steady. Total amount of rain-fall during the day .07 inch.

July 13.—Foggy weather, with variable, fresh, and brisk southeasterly wind until 8.10 a. m.; fair until 8.40 p. m. At 12.20 p. m., the wind backed to east, and continued so until midnight. Foggy weather prevailed from 8.40 p. m. until midnight. Temperature steady.

July 14.—Foggy, with fresh southeasterly wind at the beginning of the day; at 1.35 a. m. the wind veered to southwest and the weather became fair, remaining so until 9.20 a. m.; cloudy weather with light showers until 5 p. m.; fair the remainder of the day; light and gentle variable westerly winds, with a calm at 1 p. m. until midnight. Temperature rising. Total amount of rain-fall during the day, .14 inch.

July 15.—Partly fair and foggy weather, with variable, fresh, and brisk northwesterly to northeasterly wind until 9.15 a. m.; cloudy until 4.25 p. m., when a heavy rain began to fall, with falling temperature and wind, which had somewhat moderated, increasing to brisk again. The rain continued, after moderating to light, until 7.15 p. m.; fair weather, with variable, brisk, and fresh northeasterly wind, prevailed until midnight. Total amount of rain-fall during the day, .31 inch.

July 16.—Generally fair and foggy weather, with variable, brisk, and fresh northeasterly wind, until noon, by which time the wind had moderated to light. At 12.10 p. m. the wind backed to northwest, and the weather became cloudy, remaining so until 4.20 p. m. Fair and foggy weather, with variable light and gentle northwesterly wind, and a calm at 7 p. m., until midnight. Temperature rising.

July 17.—Fair weather prevailed until 10.20 a. m.; cloudy until 6 p. m., from which time the weather continued fair until midnight; variable westerly wind until 3.40 a. m. The wind veered then to northwest, and became steady, moderating in force, and calmed at 4.14 p. m. A second calm at 7 p. m; afterward a variable southwest wind set in and continued until midnight, increasing gradually to brisk. Temperature rising.

July 18.—Fair weather at the beginning of the day, which by 2.15 a. m. became foggy and continued so until 9.40 a. m.; cloudy and rainy until 2.45 p. m; generally foggy weather then prevailed until midnight. Variable, fresh, and brisk southwesterly to northwesterly winds throughout the day. A distant thunder-storm passed by this station at 1 p. m. in the west, moving from south to north. Temperature falling. Total amount of rain-fall during the day, .38 inch.

July 19.—Generally foggy and cloudy weather, with fresh and brisk variable northwesterly and westerly winds and rapidly falling temperature, during the entire day, with the exception of the time between 5.40 a. m. to 6.10 a. m., and 5 p. m. to 5.05 p. m., when a light rain fell, and from 11.40 a. m. to 2.10 p. m., during which time the weather was fair, clearing toward midnight. Total amount of rain-fall during the day .03 inch.

July 20.—Generally cloudy weather, with fresh westerly winds and falling temperature, during the day. Foggy weather toward midnight. From 8 p. m. to 9 p. m. the wind had calmed entirely.

July 21.—Foggy and cloudy weather, with steady, fresh, and gentle west and northwest wind, until 3.40 p. m. Fair weather until midnight. At 9 p. m. the wind calmed and the sky was perfectly clear. Temperature still declining.

July 22.—Variable, gentle southerly winds and partially cloudy and fair weather until 10 a. m., when the wind backed to northeast and soon afterward to southwest; during the afternoon the wind veered to east and south, and at midnight to southwest. Generally foggy and cloudy weather until 9 p. m. and fair until midnight. Temperature rising slowly.

July 23.—Foggy and fair weather, with variable southerly to westerly winds, until 7.25 a. m., when the wind veered to northwest. Generally cloudy and fair weather, with occasional calms, until 10 p. m., when the weather became perfectly clear. Temperature rising.

July 24.—Clear weather until 3.30 a. m.; fair and foggy, with steady, gentle northwest wind until 8 a. m., when the wind veered to northeast, and finally to southwest. Cloudy and foggy weather, with occasional calms, until 9 p. m., when the weather became fair and clear by 10.39 p. m. At 10.14 p. m. the wind veered to northwest and north, and continued so until midnight. Temperature steady.

July 25.—Generally fair and cloudy weather, with variable and steady northwest to southwest winds, until noon. Foggy and rainy weather, with variable south and southwest wind, which increased to brisk by 8 p. m., until midnight. Temperature slightly falling. Total amount of rain-fall during the day, .24 inch.

July 26.—Foggy and rainy weather, with variable brisk and fresh southwest wind, until midnight. Temperature slightly rising. Total amount of rain-fall during the day, .19 inch.

July 27.—Foggy and cloudy weather until 10.30 a. m., when rain began to fall, and continued with but little interruption until midnight. Steady and variable southwest wind prevailed during the day. Three thunder-storms passed during the day over this station; the first with light rain at 1 p. m., advancing from north to south; the second and third with heavy rain, moving from south to north, at 6.40 p. m. and 11.55 p. m. respectively. A distant thunder-storm passed by in the east at 6 p. m., moving from south to north. Temperature steady. Total amount of rain-fall during the day, 1.58 inches.

July 28.—Rainy and foggy weather until 7.45 a. m., when the weather became cloudy, remaining so until 3.39 p. m., when a heavy rain began to fall, ending at 5.32 p. m. Foggy weather during the remainder of the day. Variable, fresh, and brisk westerly winds prevailed throughout the day. Three thunder-storms passed over this station during the day; the first, with heavy rain, at 1 a. m., moving from south to north. The second and third thunder-storms followed each other in short succession from 3.39 p. m. to 5.32 p. m., moving from southeast to northwest, during the passage of which the greatest amount of rain fell so far here on record, amounting to .99 inch within 1 hour and 53 minutes. Temperature steady. Total amount of rain-fall during the day, 1.49 inches.

July 29.—Generally fair and cloudy weather, with steady northwest wind and slightly diminishing temperature, prevailed throughout the day.

July 30.—Fair and foggy weather until 7.35 a. m. Cloudy until after 10 a. m. At 11.25 a. m. light rain began to fall, and continued with little interruption until 3.45 p. m. Generally foggy and cloudy weather until 11.20 p. m. Fair at midnight. Steady northwest wind prevailed until 7.20 a. m., backing then in short succession to west, southwest, south, southeast, and finally east, until noon, and continued a variable southerly wind with increasing force until midnight. Temperature rising. Total amount of rain-fall during the day, .31 inch.

July 31.—Fair weather until 8.15 a. m. Generally foggy and cloudy weather prevailed the remainder of the day. Light rain fell from 1.15 p. m. to 2.55 p. m. Light to fresh southerly winds until 6.20 p. m., when the wind veered to northwest, and increasing to brisk continued until midnight. Temperature steady. Total amount o rain-fall during the day, .27 inch.

MONTHLY SUMMARY.

Mean temperature during July, 1873	56°.4
Highest observed temperature	72°
Lowest observed temperature	46°
Total amount of rain-fall	6.59 in.
Number of rainy days	15
The prevailing winds were from	NW. and SW.
Number of miles traveled	7,131

All instruments in use are in good condition.

Abstract of journal for the month of August, 1873; station, summit of Mount Mitchell, North Carolina.

August 1.—Generally foggy and cloudy weather, with steady temperature and northwest and west winds, which until noon were variable and mostly brisk, but becam steady and fresh during the remainder of the day, prevailed throughout the entir day.

August 2.—Fair weather in the earlier morning. Generally foggy and cloudy unti after 8 p. m., when the weather became fair and remained so until midnight. Light rain from 6.50 a. m. to 7.45 a. m. Steady fresh northwest wind prevailed throughout the day. Temperature slightly falling. Total amount of rain-fall during the day, .0 inch.

August 3.—Generally fair and cloudy weather, with rising temperature and steady fresh northwest wind, prevailed throughout the day. Light rain fell from 6.30 p. m. t 6.48 p. m., and from 7.20 p. m. to 7.40 p. m. A distant thunder-storm passed by thi station, in the south, at 3 p. m., moving from southwest to northeast. Total amount o rain-fall during the day, .07 inch.

August 4.—Fair weather, with variable westerly winds, until 7.35 a. m. Generally foggy and rainy weather until midnight. Temperature slightly falling. Total amount f rain-fall during the day, .55 inch. Thunder-storm at 2.20 p. m., moving from west o east.

August 5.—Foggy weather, with variable easterly winds and falling temperature, hroughout the entire day.

August 6.—Generally foggy weather, with variable easterly winds, until 9.15 p. m., vhen the wind veered to south and the weather became fair. Temperature low for he season.

August 7.—Generally foggy and cloudy weather, with variable south and west winds, hroughout the day. Temperature rising.

August 8.—Fair weather prevailed until 4.20 a. m., when fog settled on the mount-ins and continued until midnight. Light rain fell from 9.10 a. m. until 9.40 a. m., nd partly heavy and light rain from 4.25 p. m. to 5.10 p. m. Steady, fresh, and brisk orthwest wind prevailed throughout the day. Temperature slowly rising. Total mount of rain-fall during the day, .43 inch.

August 9.—Generally foggy weather, with heavy rain from 2.15 p. m. until 9.15 p. n., when the weather became fair. Generally brisk and fresh, steady and variable orthwest wind prevailed during the day, moderating to light by midnight. Tempera-ure rising but slowly. Total amount of rain-fall during the day, .20 inch.

August 10.—Fair weather continued until 10.15 a. m. Cloudy until noon. At 1 p. m. ight rain began to fall, increasing to heavy during the passage of a thunder-storm, which noved from east to west over this station at 2 20 p. m. Cloudy and foggy until 7.32 p. n. Partly heavy and light rain from 7.32 p. m. until 10.30 p. m., clearing toward and t midnight; steady, gentle, and fresh northwest wind until 10.40 a. m., when he wind veered to northeast and continued a variable easterly wind until midnight. 'emperature steady. Distant thunder-storms in southwest from 2.30 to 3.15 p. m. 'otal amount of rain-fall during the day, 1.17 inch.

August 11.—Fair weather until after 8 a. m. Generally foggy and cloudy, with heavy ain from 4.25 p. m. to 4.40 p. m., until 6.20 p. m. Fair during the remainder of the day. 'ariable, gentle, and fresh northeast to south winds throughout the day. Temperature alling. Total amount of rain-fall during the day, .15 inch.

August 12.—Fair weather continued until 8.25 a. m. Cloudy until 7.30 p. m. Foggy he remainder of the day. Gentle and fresh variable westerly winds prevailed through-ut the day. Temperature rising. During the afternoon three distant thunder-storms assed by this station, viz, at 2 p. m. in the southwest, at 5 p. m. in the northwest, and t 6 p. m. in northeast.

August 13.—Light rain in the early morning from 12.25 a. m. to 12.40 a. m. Foggy ntil 6.25 a. m. At 6.25 a. m. a very severe thunder-storm with heavy rain passed ver this station, advancing from north to south. Heavy rain continued until 1.15 p. n. Clearing at 3 p. m., but clouding over by 4.20 p. m. Foggy from 6.48 p. m. until nidnight. Temperature falling rapidly during the passage of the thunder-storm, and emaining low during the remainder of the day. Variable fresh westerly winds pre-'ailed throughout the day. Total amount of rain-fall during the day, 1.90 inch.

August 14.—Foggy weather until noon, when the fog slowly disappeared. Sky overed with heavy cumulus clouds until after 5 p. m. Fog again then settled upon the nountains. Shortly after 10 p. m. the fog nearly disappeared, revealing a cloudless ky, and remaining so until midnight. Temperature low and falling. Variable, brisk, nd fresh west and northwest winds prevailed throughout the day.

August 15.—Foggy weather, with showers of light rain from 8.30 a. m. to 8.50 a. m., nd from 9.50 a. m. to 10.10 a. m., until noon, when the fog disappeared, disclosing the ky covered with heavy cumulus clouds. Fair weather prevailed from 5.20 p. m. ntil midnight. Temperature low, but slowly rising. Variable westerly winds hroughout the day. Total amount of rain-fall during the day, .06 inch.

August 16.—Generally fair until 8.25 a. m., when the weather became cloudy, remain-ng so until 3.40 p. m. Foggy during the remainder of the day. Fall of light rain rom 3.10 p. m. to 4.03 p. m. and from 6.15 p. m. to 6.40 p. m. Temperature rising onsiderably. Variable fresh westerly winds, which moderated to gentle and light rom 11 a. m. until after 6 p. m. and increased then again to fresh, prevailed through-out the day. Total amount of rain-fall during the day, .04 inch.

August 17.—Foggy weather continued until 10.35 a. m., when a light rain began to all, ending at 11.08 a. m. Generally foggy and cloudy until 1.32 p. m. Partly heavy nd light rain until 3.25 p. m., clearing at 4.14 p. m., but clouding over shortly after-vard. Light rain again fell from 8.35 p. m. until 9.11 p. m. Foggy the remainder of he day. Distant thunder-storms at 2 p. m. in south, at 8 p. m. in west, and at 9 p. m. n southwest. Heat-lightning around the whole horizon from 7 p. m. to 7.45 p. m. 'ariable fresh and gentle east to south winds until noon; variable fresh south to south-vest winds until midnight. Temperature slightly rising. Total amount of rain-fall luring the day, .40 inch.

August 18.—Foggy weather, with heavy rain from 1.10 a. m. to 1.35 a. m., until shortly fter 8 a. m., when the weather became cloudy, remaining so until 2 p. m., with the xception of the time from 10.40 a. m. to 11.06 a. m., during which light rain fell. At

2 p. m. light rain then began to fall, becoming heavy at 2.10 p. m. during the passa of a thunder-storm, which advanced slowly from west to east, and moderated again 2.53 p. m. The rain ended at 5.15 p. m.; cloudy until after 8 p. m.; fair the remaind of the day. Variable fresh and brisk south and southwest winds until 2 p. m., whe the wind veered to northwest and moderated to gentle, but increased to brisk a veered to north during the passage of the thunder-storm, after which the wind back to west and remained so, moderating to light, until midnight. Temperature risi until 2 p. m., but falling rapidly until 3.10 p. m., when it rose slightly and beca steady. Total amount of rain-fall during the day, .70 inch.

August 19.—Generally fair weather until 7.30 a. m.; cloudy until noon; foggy, wi fall of light rain from 3.25 p. m. to 4.45 p. m., and of heavy rain from 6.38 p. m. to 7. p. m., until midnight. Temperature slightly falling. Variable gentle and lig westerly and easterly winds, with occasional calms until after 3 p. m., when the wi veered to north and northeast and increased to fresh, remaining so until midnig Total amount of rain-fall during the day, .54 inch.

August 20.—Heavy rain at the early beginning of the day. Fair and foggy, wi light rain from 10.05 a. m. to 10.20 a. m., until noon. Generally foggy, with very hea rain, until midnight. Temperature steady. Generally variable light to fresh easter wind, with occasional calms during the forenoon, prevailed throughout the day. Tot amount of rain-fall during the day, 2.08 inches.

August 21.—Generally foggy and cloudy weather prevailed, with light rain-fall fro 2.30 p. m. to 2.40 p. m., and 4.20 p. m. to 4.50 p. m., throughout the day. Variab fresh southeast to west winds, with a calm at 2 p. m., during the entire day. Tempe ature rising. Total amount of rain, fall during the day, .16 inch.

August 22.—Generally cloudy and fair weather until 9.10 a. m., foggy until 10.46 a. when light rain began to fall, increasing soon to heavy and ending at 11.36 a. Light rain during the greater part of the afternoon. Cloudy until 10.15 p. m. Fa until midnight. A thunder-storm, with light rain, passed over at 3 p. m. moving fro northwest to southeast. Steady westerly winds until 10 a. m. Variable fresh nort east wind until midnight. Total amount of rain-fall during the day .25 inch.

August 23.—Fair weather in the morning, cloudy during the forenoon and afternoo fair until midnight. A distant thunder-storm passed by at 2 p. m. in the northea Light rain from 3 p. m. to 3.25 p. m. Variable east to northwest winds throughout t day. Temperature rising. Total amount of rain-fall during the day, .03 inch.

August 24.—Generally fair weather, with rising temperature and light to fresh nor to northwest winds, with occasional calms, prevailed throughout the day.

August 25.—Fair weather continued until after 3 p. m. Partly foggy and clou during the remainder of the day. Light rain-fall from 6.30 to 6.50 p. m. Temperatu still rising. Variable westerly winds prevailed until 6.30 p. m., when a steady, bri northwest wind set in and remained so until midnight. Total amount of rain-fall du ing the day, .03 inches.

August 26.—Partly foggy and cloudy weather during the entire day, with the e ception of the time from 6.40 p. m. to 7.20 p. m. when a heavy rain fell. The fresh a brisk northwest wind continued steady until midnight. Temperature falling slow Total amount of rain-fall during the day, .11 inch.

August 27.—Foggy and cloudy weather until 8.30 a. m., when it became fair, b cloudy again shortly after 1 p. m., remaining so until midnight. Distant thunde storms at 9 p. m. in west and north and at 3 p. m. in southeast and east. Temperatu falling. Steady fresh and brisk northwest wind until after 1 p. m., when the wind back to west and moderated to gentle, but increased to fresh by midnight.

August 28.—The weather continued foggy until 5.57 p. m., when a light rain beg to fall, ending at 8.10 p. m., after which the weather became fair, but was foggy aga by midnight. Variable southwest to east winds throughout the day. Temperatu falling considerably. Heat-lightning on western horizon at 9 p. m. The singular ph nomenon of a fog-bow of great brilliancy, caused by the moon, was observed at 10 m. Total amount of rain-fall during the day, .34 inch.

August 29.—Generally fair and foggy until 8 a. m.; cloudy until 4.25 p. m.; part fair and cloudy until midnight; variable southwest to northwest wind prevailed d ring the day. Temperature steady. Light rain-fall from 3.15 p. m. to 3.40 p. m. Di tant thunder-storm at 3 p. m. in the west. During the latter part of the afternoon t valleys were filled with heavy cumulus clouds. Total amount of rain-fall during t day, .06 inch.

August 30.—Fair weather at the beginning of the day, foggy until 10.30 a. m.; clou until shortly after 5 p. m.; generally fair the remainder of the day. Clear at midnig Variable fresh to brisk westerly winds prevailed throughout the day. Temperatu steady.

August 31.—Fair weather continued until 5.25 a. m., when a dense fog settled on t mountains, remaining so until shortly after 8 a. m.; cloudy until 3 p. m.; fair t remainder of the day. Variable and steady westerly winds prevailed throughout t day. Temperature rising.

MONTHLY SUMMARY.

Mean temperature during August	55°.3
Highest observed temperature	69°.
Lowest observed temperature	43°.
Total amount of rain-fall	9.34 inches.
Number of rainy days	21
The prevailing winds were from	N.W.
Number of miles traveled	6,156

Instruments in use are all in good condition.

September 1.—Partly fair and cloudy weather, with rising temperature and light to fresh variable westerly winds, throughout the day.

September 2.—Generally cloudy until 3.35 p. m., when a heavy rain began to fall, ending at 6.20 p. m.; foggy until 9.20 p.m.; fair until midnight. Variable gentle to fresh westerly winds prevailed throughout the day. Temperature slightly falling. Total amount of rain-fall during the day, .52 inch.

September 3.—Generally foggy and cloudy weather with steady temperature and variable southeast to southwest and west winds, which shortly after 6 p. m. became brisk throughout the day. Light rain fell from 2 p. m. to 2.35 p. m. Heat-lightning at 7 p. m. on northeastern horizon. Total amount of rain-fall during the day, .03 inch.

September 4.—Partly foggy and cloudy weather, with falling temperature and brisk variable and steady southwest to northwest winds, throughout the day. Fall of light rain from 10.15 a. m. to 10.50 a. m. Total amount of rain-fall during the day, .09 inch.

September 5.—Foggy weather, with slightly rising temperature, and variable brisk southwest to northwest wind throughout the day. Light rain fell from 12.35 p. m. to 1.35 p. m., and heavy rain from 3.20 p. m. to 4.05 p. m., during which time the wind veered suddenly to northeast, but backed to northwest after the rain ended. Distant thunder-storm at 6 p. m. in the north. Total amount of rain-fall during the day, .28 inch.

W. E. SMITH,
Observer-Sergeant Signal-Service, U. S. A.

G.

Abstract of journal for the month of August, 1873.

BASE OF MOUNT MITCHELL, YANCEY COUNTY, NORTH CAROLINA.

July 29, 1873.—Arrived at "Old Fort," McDowell County, North Carolina.

July 30.—Proceeded to summit of Mount Mitchell, compared barometer with those at that station, and selected site for base station.

July 31.—Returned to "Old Fort."

August 2.—Started for "Toe River Valley," in a wagon drawn by three mules, traveled thirty miles, and laid over for the night at the base of the Blue Ridge Mountains.

August 3.—Crossed the "Blue Ridge" and arrived at site of station at 10 p. m.

August 4.—Commenced to put instruments in position. Worked hard all day.

August 5.—Everything in readiness except the "Daniells" battery for self-registering anemometer, which is not yet in order.

Comparative readings of barometers Nos. 185 *and* 1915, *taken on the summit of Mount Mitchell July* 30, 1873.

Summit barometer, (No. 185.)			Base barometer, (No. 1915.)		
Time.	Barometer.	Attached thermometer.	Time.	Barometer.	Attached thermometer.
10.40 p. m	23.87	63	10.40 p. m	23.89	63
10.50 p. m	23.88	63	10.50 p. m	23.89	64
11.00 p. m	23.86	62	11.00 p. m	23.88	63
11.10 p. m	23.86	62	11.10 p. m	23.89	63
11.20 p. m	23.87	62	11.20 p. m	23.89	62
11.30 p. m	23.87	62	11.30 p. m	23.88	62
11.40 p. m	23.86	63	11.40 p. m	23.88	63

The difference of the readings of the two barometers cannot be noted, owing to the summit station not being furnished with the instrumental error of barometer No. 185.

August 6.—The barometer has fluctuated some during the day. An increase of pressure was shown from 6 to 9 a. m., but fell off .08 by 5 p. m., and increased slightly from that time until midnight, giving a mean of 27.517. The thermometer read 60° at 1 a. m., sank gradually until 5 a. m., when the column began to ascend and attained a maximum of 80° at 12 o'clock, (noon,) decreased during the afternoon, and finally reached a minimum at 54° at 12 p. m. Mean thermometer, 64°.2. Humidity ranged between 54 and 94 per cent. With the exception of a light easterly wind, from 8 a. m. to 2 p. m., the atmosphere has remained perfectly calm. About one-half of the sky was covered by stratus clouds at 1 a. m.; they, however, disappeared at 2 a. m., only to re-appear at 3 a. m. and remain throughout the day, varying in amount from one to three-fourths, and completely covering the sky at last observation. Cumulus and cirrus clouds were observed during the day; the latter having a great elevation and being very beautiful.

August 7.—The barometer sank unevenly from 27.48 at 1 a. m. to 27.36 at 5 p. m., and then began to rise, and continued until midnight. Daily mean barometer, 27.426. The minimum temperature, 55°, was shown at 1 a. m.; the mercury then began to ascend slowly, and after 7 a. m. accelerated its pace, and attained a maximum of 76° at 10 a m.; decreased regularly and slowly the rest of the day. Daily mean thermometer, 66°.2. Humidity ranged from 63 to 95 per cent., being greatest during the night hours. A calm has prevailed throughout the entire day. Stratus clouds covered the sky at 1 and 2 a. m., having a motion from the south; by 3 a. m. they had partly disappeared, but soon formed again, rendering it cloudy at 4 a. m.; they broke up shortly after, and began to move off from the southwest, being invisible at 5.30 a. m. Cumulus clouds now appeared, having a slow motion toward the northeast. Cirrus clouds formed after 7 a. m., greatly elevated; several forms of the "curl clouds" were observed, the "horse-tails" and "twisted tufts" being the most numerous. Stratus clouds formed again at 9 a. m., and continued the remainder of the day, varying in amount from one to four fourths. Cumulus and cirrus clouds were seen during the day, their motion being from the west. Some very well-defined cirro-cumulus clouds were observed at 10 and 11 p. m.

August 8.—The barometer increased a little from 1 to 9 a. m., at which time the maximum reading of the day occurred, and then began to decrease, and continued slowly until 5 p. m., having then fallen .07; from that time until midnight its course was marked by fluctuations, but the last reading shows a slight gain. Mean daily barometer, 27.375. A steady temperature of 60° was shown by the thermometer, between the hours of 1 and 4 a. m.; after the latter hour the column began to ascend and attained a maximum of 77° at 1 p. m.; during the afternoon and evening the mercury sank evenly, and finally dropped to 60° again. Mean daily thermometer, 66°.2. Humidity ranged from 73 to 100 per cent. Gentle westerly winds were felt at the hours of 1, 4, and 5 p. m., the remainder of the day being perfectly calm. A fog arising from the river enveloped the station from 1 to 3 a. m., but dissipated soon thereafter. Stratus clouds covered the sky at 4 a. m. and as the morning advanced assumed a threatening appearance, which was verified by a rain, varying from light to heavy, commencing at 8.25 a. m., and continuing at intervals until 11.25 a. m.; commenced to clear up shortly after the rain ceased; the stratus clouds moved off from the west and disappeared. Large masses of white cumulus clouds now put in an appearance, moving slowly from the west, accompanied by a few silvery cirrus clouds floating at a great height in the air, and moving much slower than the cumulus clouds. Stratus clouds partly covered the sky at 2 p. m., increasing until rain descended, at 4.48 p. m., lasting only a short time. A few stratus clouds were visible during the evening, and above them about one-fourth cirrrus clouds, which at one time assumed the cirro-stratus formation. A fog commenced to rise at 10 p. m., and at 11 p. m. all was hidden. Whole amount of rain collected during the day, .05.

August 9.—The pressure of the air, as shown by the barometer, increased slightly during the morning until 9 a. m., and then began to decrease, going down regularly until 5 p. m., when it began to rise, and continued advancing the rest of the evening. Mean barometer, 27.371. A minimum temperature of 60° was shown from 1 to 3 a. m., and then the mercury commenced to rise at the rate of one degree per hour until after 6 a. m., when it rose rapidly—the 7.14 a. m. showing a rise of six degrees, and the 8 a. m. a rise of 10° since last observation. After 8 a. m. and until 3 p. m. the column fluctuated considerably between 77° and 80°, the latter number being the maximum, and was read at 11 a. m. and again at 1 p. m. At 4 p. m. the temperature began to decline, and was still falling at last observation. Mean temperature, 69°.5. The percentage of humidity was very large, being above 90 per cent. for thirteen hours of the day. The atmosphere was perfectly calm until 7.30 a. m., when a gentle wind sprung up from the northeast, and continued steady in that direction for six and a half hours, being the longest time that wind has been felt since the establishment of the station. Calmed again at 3 p. m., and remained so for the rest of the day. Stratus clouds, having a tardy motion from the west, covered the sky at 1 and 2 a. m. A fog then began to rise from the river and sides of the mountains, and soon hid every object from view, which continued until after 4 a. m., when it began to ascend, forming four-fourths stratus at 5 a. m., and dissipating shortly after 6 a. m. Cumulus clouds now formed and remained, looking majestic and grand, the greater part of the day. A shower of rain fell between 3.10 and 3.40 p. m. Stratus clouds were seen again at 4.30 p. m., and continued visible the rest of the evening, varying in amount from one to four-fourths, and moving slowly from the west and north. Another shower of rain fell from 7.20 to 8.30 p. m. Cirro-cumulus clouds were seen at 9 and 11 p. m., but were not well defined. A fog formed and hid everything at 12 p. m. Amount of rain collected during the day, .08. A very heavy dew has been deposited every night during the past week.

August 10.—The barometer has fluctuated continually to-day, the oscillations being comprehended between 27.38 and 27.43. Mean barometer, 27.390. The thermometer was unsteady in the early part of the morning, falling off from 63° at 1 a. m. to a minimum of 59° at 5 a. m. After 6 a. m. it began to rise, and acquired a maximum of 81° at 11 a. m. and fell 10° within the next hour, (rain falling at the time,) commenced to rise again at 1 p. m. and continued slowly until 5 p. m., when it began to sink, going down gradually to 60° at 12 p. m. Mean thermometer, 69°.1. Calm from 1 to 3 a. m., and then a light northeaster was felt, but soon died away. A light northwest breeze set in at 9 a. m., but changed to northeast at 10 a. m., and remained in that direction until after 4 p. m., when it calmed again. A gentle north wind sprung up about 7 p. m., changing to northwest at 7.30 p. m., and kept that direction until 10.20 p. m. and then grew calm. The fog reported in my journal at 12 p. m. of yesterday still continues this morning, and, if possible, grows more dense. After 4 a. m. it partly cleared off and revealed about one-fourth cirrus clouds, and soon after 6 a. m. had entirely disappeared. Cirro-cumulus clouds were then seen moving from the west. Cumulus clouds soon succeeded the compound combination, and, from the intense heat of the sun, rose up in large, rounded, beautiful masses, which covered the sky at 11.30 a. m. A thunder-storm commenced very suddenly at 11.35 a. m., and soon the rain became general and the valley filled with rain-clouds. Rain ceased at 12.30 p. m. Stratus clouds were visible during the greater part of the remainder of the day. Cumulus, cirrus, and cirro-cumulus were also seen moving from some northerly point until hidden by stratus clouds at 6.20 p. m. A light shower of rain fell from 6.38 p. m. to 6.55 p. m. Commenced again, very heavy, at 7.25 p. m., the water at times coming down in torrents. Rain ended at 9.46 p. m., and the clouds began to clear off and at 11.30 p. m. had all disappeared, but a fog commenced to form and was fast covering objects at last observation.

August 11.—The barometrical column oscillated some to-day, but the fluctuations are not such as to call for special remark. Daily mean barometer, 27.372. The thermometer was steady at 61° and 60° until after 6 a. m., when it began to increase and went up to a maximum of 76° at 11 a. m., and sank gradually to a minimum of 59° at 12 p. m. Mean daily temperature, 67°.7. The humidity to-day has been great; the hygrometer indicated 100 % at 6 a. m. Calm from 1 to 8.30 a. m.; a gentle breeze then set in from the southeast, and kept steady at that point until 3.15 p. m., and from that time until after dark there ensued a succession of calms and light east winds, but finally calmed at 9 p. m., remaining so at last observation. A dense fog hung over the station until 6 a. m., and then began to lift, and as it ascended dissipated and had entirely dissolved at 7 a. m. Stratus clouds were seen for a few hours after sunrise, and also a few cirrus and cumulus. The stratus and cirrus clouds had all disappeared at 9.30 a. m., leaving lofty cumulus clouds, varying in amount from one to two fourths, and moving for a couple of hours from the southeast, but changed direction to northwest at 1 p. m. and to south at 2 p. m. Stratus clouds now formed, and with the cumulus clouds increased until the sky was overcast, at 5 p. m. Stratus clouds continued increasing, hiding the upper clouds, and presented a threatening appearance soon after sunset. A light rain fell about dark; the amount collected being too small for measurement. Cleared up soon after the shower; the stratus clouds moved off from the southeast, revealing one-fourth cirrus clouds, progressing slowly toward the east. A perfectly clear sky was observed at 9 p. m., the moon and stars shining brightly. About one-fourth cumulus clouds formed a little before 10 p. m., but soon passed over from the south, and shortly after cirrus clouds, greatly elevated, and moving the opposite direction to that of the cumulus clouds, were seen. At midnight ill-defined cirro-cumulus clouds, having the appearance of the shorn side of a fleece of wool, were noticed moving from the southwest. At the same time a long line of fog could be seen lying close to the base of the mountains, and encircling the whole valley. A halo around the moon was first noticed at 10.45 p. m., the color being of a faint yellow or straw color, the outer edges being tinged with a pale red.

August 12.—The barometer fluctuated between 27.35 and 27.37 until 9 a. m., and then commenced to fall and sank quite rapidly to 27.28 at 3 p. m., oscillating between that height and 27.31 the rest of the day. Mean barometer, 27.324. The thermometer exhibited its minimum of 57° at 2 a. m., and increased to a maximum of 79° at 11 a. m., and after fluctuating some hours in the seventies decreased to 64° at midnight. Mean thermometer, 67°.9. Humidity ranged between 61 and 94 per cent. A calm from 1 to 9 a. m. was succeeded by a light east wind, which lasted until after 3 p. m., being, however, interspersed with short calms. A dead calm took place at 4 p. m., the atmosphere remaining in this condition at last observation. A fog hid all objects, except those in close proximity, until 6 a. m., clearing off then, and at 7 a. m. a few stratus and cirrus clouds were seen, the cirrus clouds moving from the northwest. These clouds soon disappeared and gave place to cumulus clouds, having a slow motion from the northwest, and increasing until they covered the sky. Rain to the amount of .09 fell between 3.55 p. m. and 4.30 p. m.; stratus clouds varying in amount from one to four fourths were observed from that time until last observation.

August 13.—The barometer continued sinking unevenly throughout the entire day. Mean barometer, 27.223. The thermometer was steady at 64° from 1 to 6 a. m.; advanced very slowly to a maximum of 73° at 2 p. m., and sank evenly to a minimum of 55° at midnight. Mean thermometer, 64°.5. Humidity ranged between 67 and 94 per cent. Calms and light easterly and northeasterly winds succeeded each other throughout the day. Dark, gloomy-looking stratus clouds hung over the valley, and as the morning advanced grew more heavy and threatening, took up a rapid motion from the west and approached nearer the earth. Rain began at 5.05 a. m., and fell rather heavy at times, ceasing at 9.30 a. m. Another shower fell between 10.55 and 11.10 a. m. Stratus clouds cleared off after 1 p. m. and cirrus clouds put in an appearance, moving from the southwest. Stratus, cirrus, and cumulus clouds were visible until 6.30 p. m., when they disappeared, leaving a clear sky. Whole amount of rain, .94.

August 14.—The barometer decreased irregularly to-day. Mean barometer, 27.188. The temperature has been rather unsteady, reading 53° at 1 a. m.; fell to a minimum of 51° at 3 a. m. Commenced to rise at 4 a. m. and went up suddenly twelve degrees between 6 and 7 a. m., then reading 70°, which was the maximum of the day. After this it fell off to 67° and 68°, but at noon reached the maximum point again and remained there for three hours, and then decreased to 57° at 7 p. m.; it fluctuated between 57° and 59° the rest of the day. Mean temperature, 61°.2. Calm the first three hours of the morning, and then a light northeast wind set in, changing at 9 p. m. to north, in which direction it remained until 5 p. m. and then calmed, lasting two hours. For the remainder of the day there ensued a succession of calms and light north and northeast winds. Clear at 1 a. m., but a fog began to rise from the river and sides of the mountains, hiding everything at 2 a. m. At 3 a. m. it began to rise, forming as it ascended large cumulus clouds, which covered three-fourths of the sky at 4 a. m., and took up a motion from the northwest, disappearing to the southeast. Stratus formed soon after, increased to three-fourths, and were also moving from the northwest, while the upper atmosphere grew hazy. Stratus and cumulus clouds were observed during the greater portion of the day, the cumulus moving from the northwest, while the atmosphere at station was tranquil, or passing gently from the north.

Received a set of signal equipments and three original records to-day.

August 15.—The barometrical column has been in continual motion to-day, rising and falling alternately; the last observation, however, shows an increase of .08. Mean barometer, 27.187. The temperature increased steadily until 9 a. m. and then remained motionless until noon, advancing then, attaining a maximum of 72° at 2 p. m., and sinking gradually to a minimum of 53° at midnight. Mean thermometer, 64°.5. Humidity ranged between 65 and 94 per cent. A calm at 1 a. m. was succeeded by a northerly breeze at 2 a. m., which calmed at 3.30 a. m., only to be broken by a light north wind at 4.15 a. m., which kept steady at that point until 4.30 p. m., and then calmed, remaining so at 12 p. m. Two-fourths stratus and one-fourth cumulus clouds with fair weather are reported at 1 a. m., but soon became cloudy as the stratus clouds increased and covered the entire sky at 2 a. m., having a slow motion from the northwest. A break in the stratus clouds at 4 a. m. revealed about one-fourth cumulus clouds moving slowly from the north; the stratus soon closed up again and remained so until rain began to descend at 7.10 a. m., lasting until 7.38 a. m. Stratus clouds began to disappear about 10.30 a. m., and soon were lost to view; the sky filled up with cumulus clouds which were now moving from the west. All clouds cleared away about sunset, affording a remarkably clear night.

August 16.—The barometer was steady until 4.30 a. m. and then commenced to rise, and continued until 2 p. m. For the next three hours it sank .08 and advanced from that time until 12 p. m. Mean barometer, 27.248. The thermometer declined regularly from 53° at 1 a. m. to a minimum of 49° at 6 a. m., (this being the lowest reading since the establishing of the station;) for the next three hours the column went up rapidly, reading respectively 6°, 7°, and 9° higher than the observation preceding. The maximum, 75°, was shown at 11 a. m., and, after fluctuating between that point and 73° for the next two hours, declined evenly to 63° at last observation. Mean thermometer, 63°.9. A calm existed during the early morning, but was broken by a light west wind at 5 a. m.; calmed soon after, and during the remainder of the day there were alternately calms and light north winds. A fog had settled over the valley nd hid everything at 1 a. m.; at 5 a. m. it broke up and discovered one-fourth cirro- umulus clouds moving rapidly from the west, and increasing to two-fourths by 6 a. ., and soon after disappeared. The fog as it ascended resolved itself into cumulus louds, which were visible the greater portion of the day, varying in amount from one- o four-fourths, and were moving from the west while the lower atmosphere grew azy. About 4 p. m. the cumulus clouds grew heavy, closed up, sank down the ountains, close to the earth in the valley, forming a complete veil. Rain commenced t 6.55 p. m., and ceased at 7.10 p. m., the amount being too small for measurement. tratus clouds were seen during the rest of the evening covering the entire sky.

August 17.—The barometer was almost motionless from 1 to 5 a. m. and then began o rise. At 10.30 a. m. the advance was checked, and in a short time the column began o sink, continuing until 6 p. m., and after rising for a couple of hours remained sta- ionary until midnight. Mean barometer, 27.311. The thermometer stood at 62° at a. m., but dropped to a minimum of 60° at 2 a. m., and held that point until 6 a. m.; ommenced to rise rapidly, reaching 76° at 9 a. m.; fell to 74° by 9.30 a. m., and kept hat height until 11 a. m., when it again ascended, reaching a maximum of 77° at noon. etween 1.40 and 2 p. m., while a shower of rain was falling, the column sank seven egrees. At 3 and 4 p. m. it read 72° and sank evenly to 61° at last observation. ean thermometer, 67°.1. No air was stirring, except a light north and northeast ind at 8 and 9 a. m. until 11.30 a. m., when a gentle breeze was felt from the south, emaining steady in that direction until 4.30 p. m.; it died away and continued calm t 11 p. m. The clouds have been very changeable to-day. Cirrus, cirro-cumulus, and tratus clouds are reported at 1 and 2 a. m., the upper clouds moving from the west hile the stratus clouds were progressing toward the southeast, and increased, hiding he upper atmosphere at 3 a. m., but opened soon after, revealing the upper clouds and isappearing at 8.30 a. m. Cirro-cumulus were visible until after 10 a. m. Cumulus ormed about 8.40 a. m., and went on increasing until rain descended, between 11 a. m. nd 12 m. A heavy shower fell between 1.40 and 2.45 p. m. Cumulus and cirrus louds were observed until 6.30 p. m., and then cleared away, leaving a haze in the pper regions. A few stratus clouds were visible at 8 p. m., which grew heavy, and ained for a short time, the balance of the sky being free from clouds. Whole amount f rain collected during the day, .28.

August 18.—The barometer has been constantly in motion during the day, but the uctuations did not exceed .04. Mean barometer, 27.311. The temperature was steady t 61° and 63° until 7.30 a. m., and then advanced evenly to a maximum of 75° at noon, nd after 1 p. m. fell off evenly to a minimum of 60° at 9 and 10 p. m. Mean ther- ometer, 65°. The percentage of humidity has been high, ranging from 72 per cent. o 100 per cent. A continued calm was broken by a gentle north wind at 9 a. m., which hanged to south-southeast and back to north again in the next few hours. Calmed bout sunset and remained so at last observation. Cloudy and rainy weather has been eported all day, the showers being frequent and some of them very heavy. Total ain-fall, .94.

August 19.—To-day's barometric readings are confined between 27.29 and 27.35. Mean arometer, 27.317. The thermometer sank from 61° at 1 a. m. to a minimum of 58° at a. m. and remained at that height until after 6 a. m., when it ascended evenly to a aximum of 73° at noon, and then fell off gradually to 63° at midnight. Mean ther- ometer, 65°.1. The calm reported at midnight of yesterday continued until broken y a light southwest wind at 2 a. m., calmed again at 5 a. m., and remained so for the alance of the day. The sky has been completely covered by clouds (principally tratus) during the entire day. Rain commenced shortly after sunset and continued t intervals throughout the evening. Amount of rain-fall, .54.

August 20.—The barometer was steady at 27.30 and 27.32 until 6 a. m., when it began o ascend, rising to 27.35 at 9 a. m. Here the advance was checked, the column began o sink, and at 1 p. m. read 27.30. Again for the next four hours no motion was per- eptible. After 6 p. m. it showed a tendency to increase, and was progressing slowly t 12 p. m. Mean barometer, 27.326. The temperature varied from the minimum, 61°, o 64° between 1 and 6 a. m., and then increased steadily to a maximum of 75° at oon and fell off gradually to 64° at midnight. Mean thermometer, 67°. No wind as perceptible until 10 a. m., when a light breeze was felt, varying in direction from ast to northeast and calming at 3 p. m., in which condition the atmosphere remained, ith the exception of a slight motion from the east at 8 p. m., until midnight. The eather to-day has been rather unsettled. Frequent showers fell during the day, and the evening, from 6.20 to 10.10 p. m., we had a continued light rain. Whole amount f rain-fall, .35.

August 21.—The barometer increased steadily from 1 to 9 a. m. and then decreased the same proportion until 2 p. m., after which there was not much change until 5.30 . m., when it began to ascend and continued so at last observation. Mean barometer, 7.358. The thermometer stood at 62° and 63° in the early morning and then went up o a maximum of 75° at 11 a. m., and fell off gradually to a second minimum of 62° at idnight. Mean thermometer, 67°.1. A calm prevailed during the day, broken occasionally by scarcely perceptible east winds. The weather to-day has been rathe mixed. Stratus clouds began forming about 1 a. m. and went on increasing, coverin the sky at 4 a. m. Shortly after they began to dissipate and were invisible at 7 a. m Cumulus clouds began to form as the stratus retired, increased to three-fourths, an moved slowly from the north and northwest; suddenly they changed direction an moved from the southwest; at the same time stratus clouds appeared coming from th east, but soon altered their course and moved in the contrary direction. Soon after 1 a. m. there commenced a succession of light showers and rapid changes in the clouds It appeared as if the clouds, becoming charged, would move up and precipitate thei moisture and then clear away. At 6 p. m. cirrus clouds were observed at a great heigh while below them were heavy masses of cumulus clouds. The lower atmosphere at th same time was quite hazy, and on the eastern side of the valley could be seen a lon line of fog lying close to the foot of the mountains. No clouds were seen after sunset except lower clouds, they varying in amount from one to four-fourths. Whol amount of rain, .25.

August 22.—To-day's barometric readings were confined between 27.37 and 27.42 Mean barometer, 27.393. The thermometer was stationary at 63°, until after 6 a. m. and then dropped to 62° (the minimum) at 7.14 a. m., advancing rapidly from that time attaining a maximum of 78° at 11 a. m. During the afternoon the column fluctuate between 75° and 67°, and, after sunset, declined gradually to 63° at last observation Mean temperature, 67°.5. A light variable northeast wind set in at 7.30 a. m., and continued until 3.30 p. m. Dark, heavy stratus clouds covered the entire sky during th early-morning hours. Rain began at 5.45 a. m., and ended at 6.15 a. m. Soon after th rain ceased the stratus clouds broke up, revealing one-fourth cirro-cumulus cloud moving from the west. At 8 a. m. the stratus clouds had all disappeared, and two-fourth cumulus and one-fourth cirrus clouds were observed, the cumulus clouds movin rapidly from the northeast, while the cirrus were moving with the same velocity fro the north. At 9 a. m. the cumulus clouds had diminished to one-fourth, the cirrus ha disappeared, and two-fourths cirro-cumulus occupied their place, while one-fourt stratus clouds were seen below. Soon after this time the stratus and cirro-cumulu clouds became invisible, the cumulus clouds increased and covered the sky at noon. A rain commenced at 12.30 p. m., and continued at intervals until 5.30 p. m. Heav stratus clouds hung over the station during the rest of the evening. Whole amount o rain, .11.

August 23.—No material change occurred in the readings of the barometer to-day Mean barometer, 27.434. The temperature ranged at 61° and 63° until after 6 a. m The column then began to rise and ascended to a maximum of 82° at 1 p. m. A thunderstorm now suddenly arose, and under its influence the column dropped seven degrees, reading 75° at 2 p. m. At 3 p. m. it had risen two degrees, and for the rest of the day decline evenly to a minimum of 57° at midnight. Mean thermometer, 68°.2. No wind to-day except a gentle northeast at 1 p. m., which changed to southeast at 2 p. m., and soon after calmed. The sky remained covered by stratus clouds until about 3.30 a. m., when a dense fog arose and enveloped the station, dissipating about 6.30 a. m. Cirrus and cumulus clouds were visible during the forenoon, moving from the west. At 1 p. m. the cumulus were moving from the northwest, and about one-fourth stratus clouds had formed, and were moving from the northeast. At 1.30 p. m. several loud peals of thunder were heard, and in a few minutes rain descended, lasting only a short time. The cumulus clouds changed direction to the northeast, and the stratus clouds to the southeast, the latter disappearing at 2.30 p. m., and the cumulus again moved from the northwest. At 4 p. m. they had again changed their course to northeast, and soon after no motion was perceptible. About sunset all clouds cleared away. Amount of rain-fall, .02. Worked nearly five hours to-day trying to establish communication with the summit, but could get no response.

August 24.—The barometer advanced slowly until 8.30 a. m., and then declined regularly until 6 p. m., and remained nearly stationary during the rest of the day. Mean barometer, 27.444. The temperature was steady at 55° and 56° until about sunrise; advanced rapidly after that, attaining a maximum of 81° at noon, at which height it remained until after 2 p. m., and then decreased to the minimum, 55°, at midnight. Mean thermometer, 65°.7. Calm all day. The sky remained clear until after 3 a. m., when a fog settled in the valley, covering all objects, but disappeared soon after 6 a. m. A few cumulus clouds were seen during part of the day, having a slow motion from the east and northeast. A haze was visible in the lower atmosphere during part of the afternoon, but vanished about 7 p. m., leaving a beautiful clear sky. Signal communication with the station on the summit was established to-day.

August 25.—The barometer decreased unevenly throughout the day. Mean barometer, 27.363. The thermometer read 55° at 1 a. m., but sank to a minimum of 52° at 3 and 4 a. m., and then began to rise, and went up to a maximum of 82° at 12 o'clock, (noon,) and declined unevenly to 65° at 12 p. m. Mean thermometer, 68°.4. The atmosphere has been perfectly calm all day. A fog began to form about 4.30 a. m., enveloping the station at 5 a. m., but soon dissipated, leaving, at 6 a. m., a line of fog along the river and the upper atmosphere hazy. At 8.30 a. m. cumulus clouds formed, and for the first three hours had a variable direction, sometimes moving from the west, northwest, and northeast, varied in amount from one to three-fourths, and disappearing soon after 6 p. m. Stratus formed about dark, moving steadily from the northwest, rendering the weather cloudy at times, and again clear.

August 26.—The barometer fluctuated considerably to-day, but shows a decrease at last observation. Mean barometer, 27.268. The thermometer has been very unsteady. A temperature of 65° at 1 a. m. fell to a minimum of 62° at 4 a. m., and went up rapidly in the next hour, reading 71° at 5 a. m., continued to rise unevenly until 2 p. m., when it gave a maximum of 83°, that being the highest point reached during the month. After this time the column sank irregularly until 12 p. m. Mean thermometer, 71.8°. Variable gentle winds were felt during the day from southeast, east, and northeast. Stratus clouds formed about 2.30 a. m., moving from some easterly quarter until near 5 a. m., when they changed direction to the west and soon after disappeared. Cumulus clouds were seen at 5 a. m., took up a rapid motion from a point a little north of west, and did not disappear until after 7 p. m. About one-fourth cirrus clouds were visible during the day, being greatly elevated. Stratus clouds formed again at 6 p. m., increased rapidly and covered the entire sky soon after 7 p. m., assuming a threatening appearance. Peal after peal of thunder was heard about 7.20 p. m., and shortly after rain descended, lasting over a half hour. Stratus clouds were visible during the rest of the evening. Total rain-fall, .14.

August 27.—The barometer showed a tendency to fall until about 4 a. m., when it began to rise, continuing until 11 a. m., reading at that time 27.29; for the next two hours it was steady, and then dropped .04 for the 2 p. m. observation; remained at that height until after sunset, and then began to increase and continued at last observation. Mean barometer, 27.262. The thermometer stood at the minimum, 62°, at 1 a. m. varied between that height and 63° until 6 a. m.; the column then began to expand and rose to a maximum of 81° at 1 and 2 p. m. At 3 p. m. it had began to contract and continued unevenly to a temperature of 66° at midnight. Mean thermometer, 70°.9. Calm until 6.30 a. m.; a light east wind was then noticed, but it died away soon after 2 p. m., the atmosphere remaining tranquil the rest of the day. Stratus clouds increased and covered the sky at 2 a. m., but moved off shortly after 4 a. m., leaving a few cumulus and cirrus clouds, the former moving from the west and the latter from the northwest. A fog was also observed hanging over the river, but was soon dissipated by the heat of the sun. The upper clouds were visible until after 5 p. m., when they became hidden by stratus clouds which began to form shortly after 3 p. m., and grew heavy and threatening during the evening. A heavy rain began at 10.37 p. m. and ended at 11.15 p. m., being the first rain we have had for twenty-five hours. Rain-fall, .17.

August 28.—The barometer rose steadily from 27.31 at 1 a. m. to 27.41 at 10 a. m.; remained at that height until 1 p. m., and sank to 27.37 at 3 p. m.; commenced to rise again at 4.30 p. m., and advanced to 27.44 at midnight. Mean barometer, 27.381. The extreme range of the thermometer to-day was only seven degrees. The column was steady at 65° and 64° until 10 a. m., advanced one degree for the 11 a. m., and fell off for the 12 m. Attained a maximum of 69° at 2 p. m., and contracted to 63° at 7 p. m., held that point until 11 p. m., and then dropped to a minimum of 62° at 12 p. m. Mean thermometer, 65°.4. Light winds, varying from east to south, were felt for a few minutes at different times of the day. The sky has been completely covered with dark, heavy clouds all day. A few light showers fell, amounting in all to .06 inch.

August 29.—The barometer continued to ascend to-day, but its course is marked by fluctuations, and the increase is small. Mean barometer, 27.478. The thermometer read 62° at the first observation, and sank to a minimum of 61° at 2 a. m., remained at that height until after 6 a. m., and then began to rise, going up to a maximum of 72° at 11 a. m., dropped one degree at noon, and reached the maximum again at 2 p. m.; contracted after this to 62° at midnight. Mean thermometer, 65°.7. Calm until 10.30 a. m., when a just perceptible east wind was felt, but which calmed at noon. About 12.30 p. m. this wind was again felt, but changed to southeast at 2.45 p. m., and calmed at 5.30 p. m., remaining so for the rest of the day. The sky remained covered by stratus clouds until near 10 a. m., when they cleared away revealing three-fourths cumulus clouds moving from the north. They soon changed their direction to west, and shortly after 12 m. became hidden by stratus clouds, which were moving from the southeast, and partly cleared away after 8 p. m.

August 30.—The barometer stood at 27.50 until after 4 a. m. and then rose to 27.55 at [illegible] a. m., decreased slowly to 27.46 at 4 p. m., and showed a slight increase at 12 p. m. Mean barometer, 27.500. The thermometer was steady at 62° until after 6 a. m., advanced and attained a maximum of 77° at 11 a. m., and decreased slowly to a minimum of 56° at midnight. Mean thermometer, 66°.6. A light northwest wind was stirring at noon, but soon died away. The sky was about half-covered with stratus clouds at a. m., which increased to four-fourths at next observation, and did not entirely disappear until after 8 a. m. Cumulus clouds formed after 6 a. m., having a rapid motion from the west, varied in amount from one to four-fourths, and disappeared after 8 p. m The lower atmosphere grew hazy in the afternoon.

August 31.—The barometer fluctuated between 27.49 and 27.47 until 3 a. m. and the dropped to 27.44 for the 4 a. m., and oscillated between that height and 27.37 for the res of the day. Mean barometer 27.421. The thermometer exhibited a minimum of 56° fo the first four hours and then advanced regularly to a maximum of 81° at 2 and 3 p. m., declining to the minimum again at last observation. Mean thermometer, 66°.7. Cal until 10 a. m., a light northeast wind then sprung up and continued until after 4 p. m., blew for a short time from the southeast about 5 p. m., and then calmed. Stratu clouds formed and covered the sky at 2 a. m.; sank down into the valley, forming fog at 5 a. m.; cleared off about 8 a. m., showing cirrus and cumulus clouds, the forme moving from the northeast and the latter from the west. Cirrus clouds disappeare about 10.30 a. m. and the cumulus clouds about sunset.

September 1.—The barometer has been constantly in motion during the past twenty-four hours; the midnight reading shows a decrease of .03. Mean barometer, 27.346 The thermometer read 55° at the first observation; ascended to 56° at 3 a. m., and san to a minimum of 54° at 5 a. m.; remained at this point until after 6 a. m., and the advanced rapidly to a maximum of 83° at 1 p. m., and declined unevenly to 62° a midnight. Mean thermometer, 67°.7. Calm until 10.30 a. m. A light south wind the sprung up, changing to northwest at 11.45 a. m. and died away after 1 p. m., remainin calm the rest of the day. Stratus clouds formed and covered the sky at 3 a. m., bu soon broke up and disappeared. A fog formed on the river, spread over the adjacent country, and covered objects at 5 a. m., and dissipated between 7 and 8 a. m. Cumulus, cirrus, cirro-cumulus, and cirro-stratus clouds were observed at different times o the day, but all disappeared about 11.30 p. m.

September 2.—The barometer fluctuated some to-day, but shows an increase of .04 a last observation. Mean barometer, 27.342. The thermometer fell from 60° at 1 a. m. t a minimum of 56° at 3 a. m.; attained a maximum of 83° at noon, which point it hel until after 2 p. m., and then declined to 61° at midnight. Mean thermometer 68°.7 No wind was perceptible until noon. A gentle east wind then set in, but soon changed to north and then calmed. Light west to southwest winds were observed at different times during the balance of the day. A haze was visible at first observation, but a fog arose and soon hid everything; cleared off during the morning, revealing cirrus clouds, varying in amount from one to three-fourths. Cumulus clouds formed about noon, having a slow motion from the west, which changed to north at 1 p. m. A light shower of rain fell between 3.25 and 4 p. m., the amount not being sufficient to measure. About 5 p. m. the cumulus clouds were again moving from the west; stratus clouds began forming and assumed a threatening appearance at 7 p. m.; at half-past seven, successive flashes of lightning were seen, accompanied by terrific thunder. This thunder-storm drew near the station, and at last appeared to be centered directly over it. Flashes of lightning now followed each other in rapid succession, their thunder causing the building to shake violently. At 7.45 p. m. the rain descended in torrents. The barometer rose rapidly, and soon the storm passed over. The clouds broke up, and part moved off, leaving the sky half covered. Fair weather continued until after 11 p. m., and then the stratus clouds increased and covered the entire sky. Whole amount of rain collected, .80.

September 3.—The barometer remained steady at 27.37 for the first two observations; sank .01 at 3 a. m.. and advanced to 27.40, at 6 a. m; exhibited this reading until after 11 a. m.; declined regularly to 27.31 at 4.14 p. m., and fluctuated between that height and 27.34 the rest of the day. Mean barometer, 27.361. The thermometer decreased from 60° at the commencement of the day to a minimum of 56° at 5 and 6 a. m. The column then began to rise and went up to a maximum of 80° at noon. Kept that point for four hours and then decreased evenly to 62° at 12 p. m. Mean thermometer, 68°. A light southwest wind sprung up at 9.30 a. m., veered by the south point to northeast at 11 a. m. and backed to south at noon, but soon settled steady from the southwest, in which direction it remained until after 4 p. m. and then calmed. Foggy, fair, and clear weather is alternately reported until after 8 a. m. Cumulus clouds then appeared moving slowly from the southwest, but became hidden by stratus clouds at 5 p. m. Stratus clouds broke up at 7.30 p. m., exhibiting a few cirrus and cumulus clouds, but spread and covered the sky again at midnight.

September 4.—The barometer fluctuated to-day between 27.27 and 27.37. Mean barometer 27.320. The thermometer was steady at 61° and a minimum of 60° until 7.14 a. m., increased to a maximum of 78° at 3 p. m., and declined gradually to 66° at last observation. Mean thermometer, 68°.6. A light northeast breeze set in about 1 p. m., lasted until after 5 p. m., and then changed to south; calmed at 9 p. m. Stratus clouds, varying from one to three-fourths, were visible until 4 a. m. Cumulus and cirrus clouds appeared then, but became hidden by stratus clouds at 9 a. m. A light rain fell between 10.18 and 10.55 a. m., amounting to .03. Stratus, cumulus, and cirrus clouds were observed until 8.30 p. m. when the two first disappeared, leaving a few cirrus clouds.

September 5.—The barometer stood 27.32 at the three first observations, the pressure hen increased, and the column advanced to 27.40 at 11 a. m., began to sink soon fter, and fell to 27.34 at 3 p. m.; began to rise again and went up to '27.40 at mid-ight. Mean barometer, 27.369. The thermometer has stood high all day; read 65° t 1 a. m., advanced to 73° at 3 a. m., and sank to 70° at 5 a. m.; began to rise soon fter, and attained a maximum of 81° at 2 p. m., and decreased slowly to a minimum f 61° at midnight. Mean thermometer, 72°.0. A gentle north wind set in about 1.30 . m., increased to fresh at 3 a. m., changed to northeast by 4 a. m., and calmed at 8.30 . m. A few southeast and northeast motions were perceptible during the afternoon; he remainder of the day was calm. Cumulus and cirrus clouds have been prevalent o-day; the cumulus clouds moving from the west and southwest and the cirrus clouds orthwest and south.

INSTRUMENTS, ETC.

In placing the maximum thermometer in position, the bulb accidentally became roken, rendering it useless. The remainder of the instruments are in good condition nd have worked well.

D. H. SACKETT,
Observer Signal-Service, U. S. A.

PAPER 18.

INSTRUCTIONS FOR MAKING AND REPORTING TELEGRAPHIC RIVER OBSERVATIONS FOR THE SIGNAL-SERVICE, UNITED STATES ARMY.

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGNAL-OFFICER,
DIVISION OF TELEGRAMS AND REPORTS FOR THE
BENEFIT OF COMMERCE AND AGRICULTURE,
Washington, D. C., April 10, 1873.

1. All measurements at each station will be made from the bench-mark or water-level in common use by river-men at that station, and the depth of water from the bed of the river to this level, at the point where the gauge in use is located, will be reported to this office at the time of sending in the first mail reports.

2. The gauge used will be put up by the observer at each station at the expense of this office, and will be made of pine or oak timber, two inches thick by ten inches in width, and of sufficient length to cover the full range of the river between extreme low-water and high-water marks. This timber will be placed edgewise and firmly imbedded in the earth, leaving one and a half inches of its width exposed above the level of the ground. The upper edge will be planed smooth, and carefully graduated in feet and inches, *after being placed in position*, taking the established bench-mark or level referred to in Par. 1 as the zero of the scale, and numbering the feet and inches both above and below that point, unless it is at extreme low-water mark, in which case the numbers will all be above the zero of the scale. [Figures 1 and 2.] Especial pains will be taken in graduating the gauge to see that the distances marked off upon it for each foot and its subdivisions will correspond exactly to the vertical foot and subdivisions of which they are the measure. This can be readily done by means of an ordinary spirit-level, a straight-edge on which to place the level, and a graduated rod, fixed vertically, from which to take the measurement.

3. Observations will be made daily from May 1 to July 31 and October 1 to November 30 of each year, and at such intermediate times as may be desired by the Chief Signal-Officer, or rendered necessary by any sudden or unexpected change in the condition of the river.

4. Whenever the rise or fall of water is gradual, one observation per day will be made at 3 p. m., local time, during the periods named above. When the change is sudden and unusual in its character, reports will be made every three hours during such change until the river resumes its normal condition.

5. Observations will be made on Sundays at the regular hours, and delivered punctually at the telegraph-office, as on other days of the week.

6. All regular reports will be sent in the cipher accompanying these instructions, and signed "Observer," only. The *name* of the observer will not be given. They will consist of five words each, (beside the address and signature,) arranged in the following order:

1. Name of station.
2. Date and time of report.

State of weather and direction of wind.
Depth of water in feet.
Depth of water in inches.

fourth word will show the distance in feet above or below the bench-mark, e fifth word the odd inches, when there are any. If the depth can be expressed alone, the word "naught" will be sent in the fifth space. When the river is at time of report, observers will use the cipher-words in the column headed ' and those in the column headed "Fall" when it is falling.

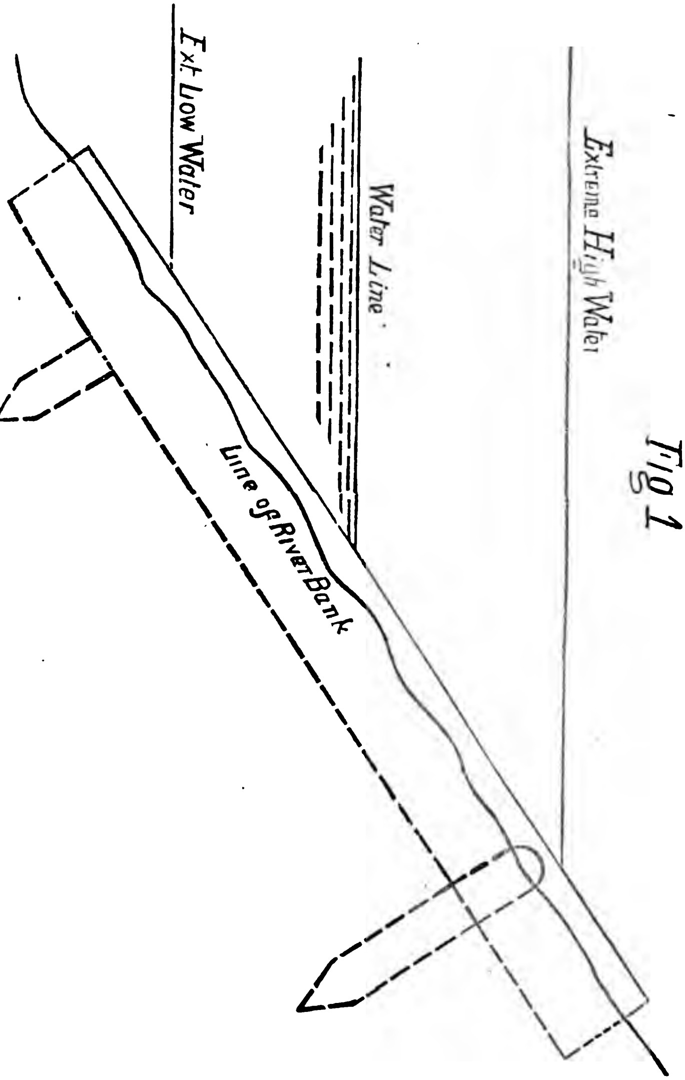

Fig 1

eports will be written in duplicate on Form 1, and one copy filed, properly and signed, at the telegraph-office within thirty minutes after the observa-de. The report from ——— will be sent to the observer-sergeant at ———. ied copy of each report made during any one day will be mailed on the morn-succeeding day to the "Chief Signal-Officer, Washington, D. C."
luplicates (Form 1) must be properly dated, timed, and signed, as indicated forms, and must also show upon their face the time at which they were filed graph-office.

9. A weekly report (on Form 27) will be made to this office, showing the number o reports sent during each day of the week; the line by which they were sent; time o filing in telegraph-office; and such other data as may be indicated by the heads of th different columns.

10. All necessary blanks, forms, stationery, &c., will be furnished by this office, an will not be purchased by observers without special authority from the Chief Signal Officer. Timely requisition will be made upon this office for additional blanks an stationery whenever necessary.

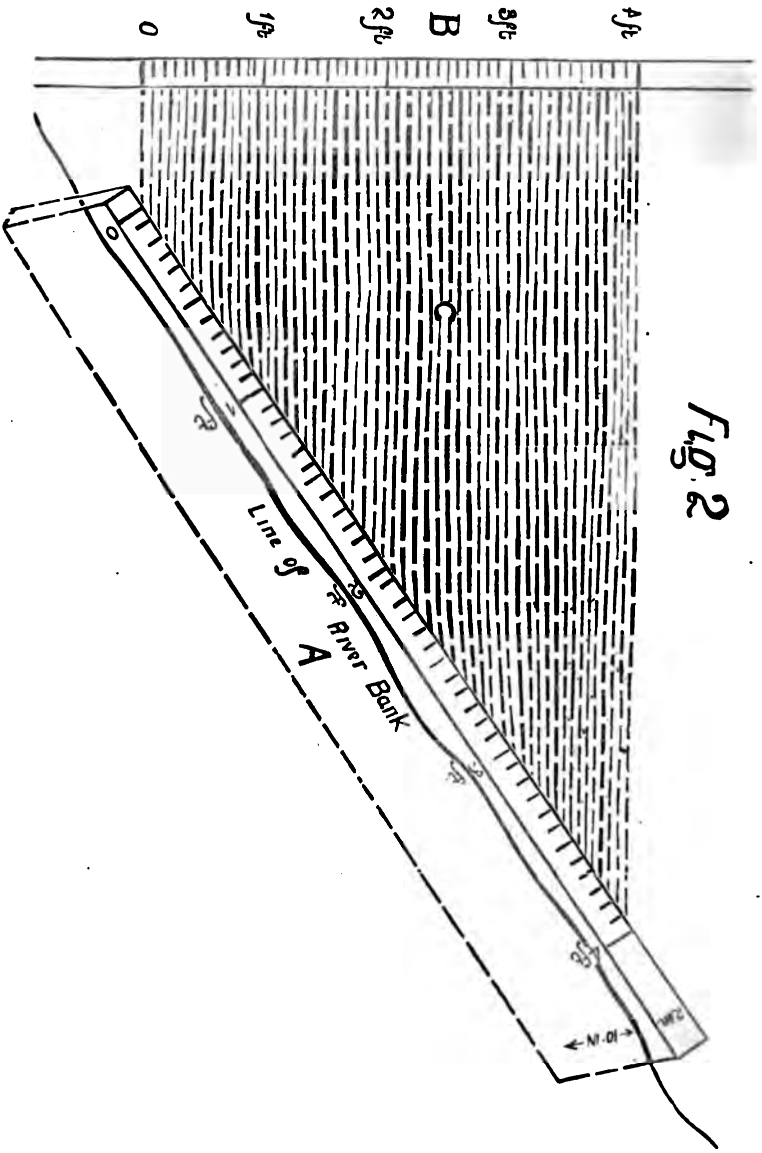

Fig. 2

"A." Plank, to be graduated, after insertion in bank, by means of the upright measuring-rod "B."
"B." straight-edge and spirit-level, crosswise, as shown by the dotted lines at "C."

11. All bills for services or for material furnished should be rendered monthly, and will be settled by the property and disbursing officer of the Signal-Office as soon after their receipt as the necessary vouchers can be signed. The bill for construction of guage will be settled promptly upon its receipt at this office. Observers will not pre-

ay telegrams or reports on official business, as settlement will be made by the office ith the telegraph company direct.

12. Observers will arrange, as far as practicable, to have some competent, reliable erson to make reports in case of their sickness or unavoidable absence; and, when his is done, will see that the person so employed is properly instructed in his duties.

13. Special telegraphic reports will be made to this office of the formation or break-ng of all ice-gorges or other obstructions in the river, and of the presence of float-ng ice or timber, when of sufficient extent to render navigation unsafe, stating, in s few words as possible, the location and extent of the gorge, break, or obstruction n each instance.

14. It is expected that all observers will make their obervations and reports *accu-ately* and *promptly*, bearing constantly in mind the fact that their usefulness, when eceived at this office, depends wholly upon these two conditions.

15. The Chief Signal-Officer reserves to himself the right of withholding payment rom any observer who shall neglect to make his reports accurately and promptly.

16. Whenever necessary, reports from adjoining stations will be sent to observers, nd will be given by them to the press, and also posted in such public places as are nost frequented by river-men and merchants interested in the condition of the river.

17. Official communications by mail, addressed "Chief Signal-Officer of the Army, Vashington, D. C.," go free of postage until June 30, 1873, after which they must be repaid. Stamps for this purpose will be furnished from the Signal-Office.

IPHER FOR TRANSMISSION OF TELEGRAPHIC RIVER OBSERVATIONS FOR THE SIGNAL-SERVICE, UNITED STATES ARMY.

INSTRUCTIONS FOR USING THE CIPHER.

1. Each report will consist of *five* words besides the address and signature. In the irst space of the form used the *name* of the station from which the report is made will e written; in the second space, the word for *date* and *time* of report; in the third space, he one for *state of weather* and *direction of wind;* in the fourth space, the *depth* of water n *feet,* and in the fifth space the *depth in inches* in excess of the feet. The cipher-words hould in all cases be written plainly and correctly.

EXAMPLE.

(Form 1.)

WAR DEPARTMENT, SIGNAL-SERVICE UNITED STATES ARMY,
DIVISION OF TELEGRAMS AND REPORTS FOR THE
BENEFIT OF COMMERCE AND AGRICULTURE.

Report of observation taken at Hermann on April 1, at 6 p. m.

Observer-Sergeant, Saint Louis.				
Hermann.	Gab.	Lomond.	Harden.	Often.
				Observer.

Handed to operator at 6.20 p. m.

NOTE.—Operators will send only the matter inside the heavy lines.

Translation.

	Name of station	Hermann.
Gab	Date of report	First day of the month.
	Time of report	6 o'clock p. m.
Lomond	State of weather	Heavy rain.
	Direction of wind	Northwest.
Harden	Height of water above bench-mark	12 feet 5 inches.
Often		

River rising.

The cipher-words to be used when the water is either *above* or *below* the bench-nark will be found on page 956. When the water is *rising*, the words will be aken from the left-hand columns; when it is *falling*, from the right-hand columns.

DATE AND TIME OF REPORT.

(*Second space in Form* 1.)

Date.	3 p. m.	6 p. m.	9 p. m.	12 mid-night.	3 a. m.	6 a. m.	9 a. m.	12 m.

Vane.	Eagle.	9	Vice.	Edge.
Vase.	Earth.	10	Vine.	Engine.
Vat.	Earn.	11	Virge.	End.
Vault.	Ease.			

All cipher-words should be written plainly and distinctly.

(Form 27.)

WAR DEPARTMENT,
SIGNAL SERVICE UNITED STATES ARMY,
DIVISION OF TELEGRAMS AND REPORTS FOR THE
BENEFIT OF COMMERCE AND AGRICULTURE.

Report of river observations made during week ending Saturday ——, 187–, at ——.

Day and date.	No. of observations per day.	Time observation made.	Time filed in telegraph-office.	Line sent by.	Remarks.
unday.........					
onday					
uesday........					
ednesday					
hursday.......					
riday					
aturday					
otal No. of observations during week.					

—— ——, *Observer.*

One copy of this form, properly filled up, will be mailed to the Chief Signal-Officer, ashington, D. C., on Monday of the week succeeding that of which it is the record. from any cause the reports are not forwarded by telegraph, the fact will be noted, ith suitable explanation, under the head of "Remarks."

APPENDIX.

The following table of elevations is furnished for the information of all observe
Any errors in the figures and any changes in location of office or elevation of barom
ter since date given opposite each station will be promptly reported to this office.
no changes have taken place since the date named in the following table, the elevati
given will be used for correcting all barometrical observations.

Station and date of last reported change.	Elevation of barometer above ground at office.	Elevation of ground at office above bench-mark.	Bench-mark.	Elevation of bench-mark above mean sea-level.	Total elevation to be corrected for.

NOTE.—By "mean sea-level" is meant the mean of the "mean low tide" and "mean high tide" given by the Coast Survey Observations.

The following table is furnished for the information and guidance of all concerned. The regular hours for taking the telegraphic observations are 7.35 a. m., 4. 35 p. m., and 11 p. m., Washington mean time.

At stations west of Washington the figures given in the table for each station will be subtracted from the above hours, and the remainder will show the proper local time for the observations.

At stations east of Washington the figures in the table will be added to these hours to obtain the proper local time. Any discrepancies discovered between the figures given here and the local time in use at each station will be promptly reported to this office.

Table showing the difference between local time and Washington mean time at the signal stations named:

PAPER 19.

The following statement showing the location of the bench-marks from which rise and fall of the western rivers is measured for the river-reports of this offic published for the information of all concerned.

BROWNSVILLE, PA.

The zero point on gauge is the depth of water in the channel on June 5, 1873, wh was 5 feet.

BRUNSWICK, MO.

The zero of scale is the low-water mark at this point.

CAIRO, ILL.

The zero of gauge is placed at extreme low water of December, 1871. Extre high water occurred in 1867, when it reached the top of the levee, which is 53 f above low-water mark.

The bench-mark is the top of the levee.

CINCINNATI, OHIO.

The bench-mark is 20 inches above the bottom of the river—extreme low wat The high-water mark is a point 65 feet 5 inches above the bench-mark.

Extreme high water occurred March 7, 1865, and extreme low water September 1858.

CONFLUENCE, PA.

Depth of river May 19, 1873, 30 inches.
Depth of river at low-water mark, 12 inches.
Zero of gauge above low-water mark, 18 inches.

DAVENPORT, IOWA.

The gauge was constructed by Colonel Macomb, United States Engineers, on the pivot on draw-bridge pier of the Government bridge, between Davenport and Rock Island. It is in the Davenport channel, and is cut in the stone-work and painted in black and graduated into feet and tenths. Its zero point is the low water of 1863, the lowest water known.

EVANSVILLE, IND.

The zero of gauge is placed at low-water mark of 1867, being 6 feet above the bed of river. A survey made at 3 p. m., April 19, 1873, gave depth of water above low-water mark (1867) 25 feet 4 inches.

FORT BENTON, M. T.

The bench-marks are two iron bars let into river-bank, one at the highest water mark of 1872, the other 19 inches above the lowest water of 1872.

The measurements give the depth of water on the bar in front of the town. The depth of water over the bar at high water is 8 feet 10 inches—at low water not over 18 inches.

NOTE.—Observer ordered by Chief Signal-Officer to use low-water mark as the zero of river-reports instead of bench-mark.

FORT SULLY, D. T.

The means of measurement are two (2) poles planed square, 6 feet 6 inches long, and accurately graduated. They have to be changed daily "to accommodate" the river. The actual depth of water is reported.

FREEPORT, PA.

The bench-mark is 4 feet 6 inches above extreme low-water mark.

HERMANN, MO.

The gauge rests upon the bed of the river and indicates actual depth of water. Depth of water April 24, 1873, at 3 p. m., 12 feet.

JEFFERSON CITY, MO.

Reports are made from low water of 1867 and high water of 1844, the river in 1844 being 31 feet higher than low water of 1867.

Depth of water May 12, 1873, at 3 p. m., 10 feet 10 inches above low-water mark.

KANSAS CITY, MO.

Low-water mark, as established by the chief engineer Missouri River Bridge Company, was in 1867, it being then lower than at any time during which a record was kept. In 1872 it was down to within 7 inches of the mark of 1867. High-water mark, 1844.

KEOKUK, IOWA.

The bench-mark is at the northeast corner of Old Pilot's Indicator, 1,400 feet above the bridge. The height above low-water mark is 24.183 feet, and above high water 8.95 feet. The measurement is not made from the bed of river.

Depth of water in channel at extreme low water, 4 feet 6 inches, and at extreme high water, 24 feet 9 inches to 25 feet 4 inches.

LEAVENWORTH, KANS.

The zero of gauge is placed to correspond with low water in Missouri River. The bench-mark is low water. When the gauge reads 4 feet above zero, there is about 5 feet of water in the river. The bottom of the river changes with the rise and fall of the river.

LEXINGTON, MO.

The zero of gauge is at low-water mark of 1861, being 10 feet 8 inches above the bed of the river. Depth of water in river opposite to gauge, according to measurement made May 15, 1873, was 17 feet 10 inches from bed of the river.

LITTLE ROCK, ARK.

The bottom of gauge is marked 2 feet, and when the water is at that mark there is 2 feet of water in the river. All river-men go by this mark, and the same is reported to the packet company at Memphis and Saint Louis.

LOUISVILLE, KY.

The zero is the sill of the lock of the Louisville and Portland Canal. The ben mark is the door-sill of house corner of Tenth and Water streets, and is 28.1 feet ab zero. Extreme high water of February 21, 1832, is 41.8 feet above zero. The depth water is taken from a gauge at the foot of Tenth street, and is used by all river-m There is no mark that gives the depth of channel.

MARIETTA, OHIO.

Depth of water at time of first report, April 17, 1873, at 3 p. m., was 13 feet 10 inc in the channel.

MEMPHIS, TENN.

The bench-mark on Exchange Building is 148.789 feet above city-level from the of the river. High water from the same datum, 100.8 feet in 1867. Low water fr same datum, 65.05, December 25, 1872. Water about 70 feet deep in front of city low water. (?)

NASHVILLE, TENN.

The bench-mark is 62.75 feet above the zero of gauge. The zero corresponds to treme low water. Bench-mark 23.25 feet above highest water since Nashville been a signal-station. No definite data as to year of high and low-water marks be obtained.

MORGANTOWN, WEST VA.

The gauge rests upon the bed of the river, and reports indicate the exact depth water in the channel.

NEW ORLEANS, LA.

The bench-mark is high-water mark of 1871, (and is marked on the city tide-gau at which the zero of gauge (from which all river measurements are made) is pla From this point to the bottom of the river is approximately 178 feet. The zero is feet above sea-level and 10.5 feet below the city datum-line.

OMAHA, NEBR.

The gauge is attached to a pier of the Union Pacific Railroad bridge, and its zer the low-water mark of 1867. The high-water mark of the same year is 19 feet ab zero of gauge.

PADUCAH, KY.

Depth of water in channel of the river is 59 feet—May 23, 1873. Depth of water low zero of gauge, 56 feet. Low-water mark—depth of channel in 1854—8 fee inches.

PITTSBURGH, PA.

The gauge measures the depth of water in the channel. The greatest depth th can be measured by it is 35 feet; the least is two feet. When the water falls bel 2 feet another gauge is used. The lowest water-mark known is 9 inches in the cha nel; the highest water has never reached the top of gauge.

PLATTSMOUTH, NEBR.

There is no fixed bench-mark at this place. Depth of water at 3 p. m., April 19, 18 3 feet 3 inches.

SHREVEPORT, LA.

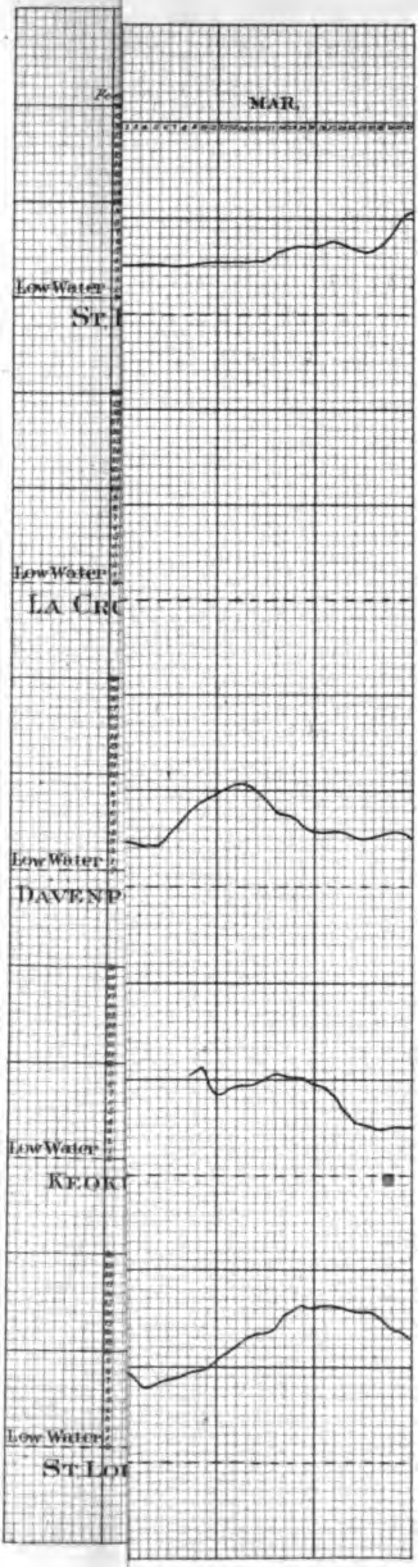
The bench-mark is on Commerce street, adjoining the "Transfer Grounds" of t Texas Pacific Railroad. The lowest water-mark, 1872, the reference point in reporti depth of river, is in the bed of river, and 40 feet below high water of 1849, and 25 fe above bottom of river. From bottom of river to high-water mark of 1849 is 65 feet.

SAINT JOSEPH, MO.

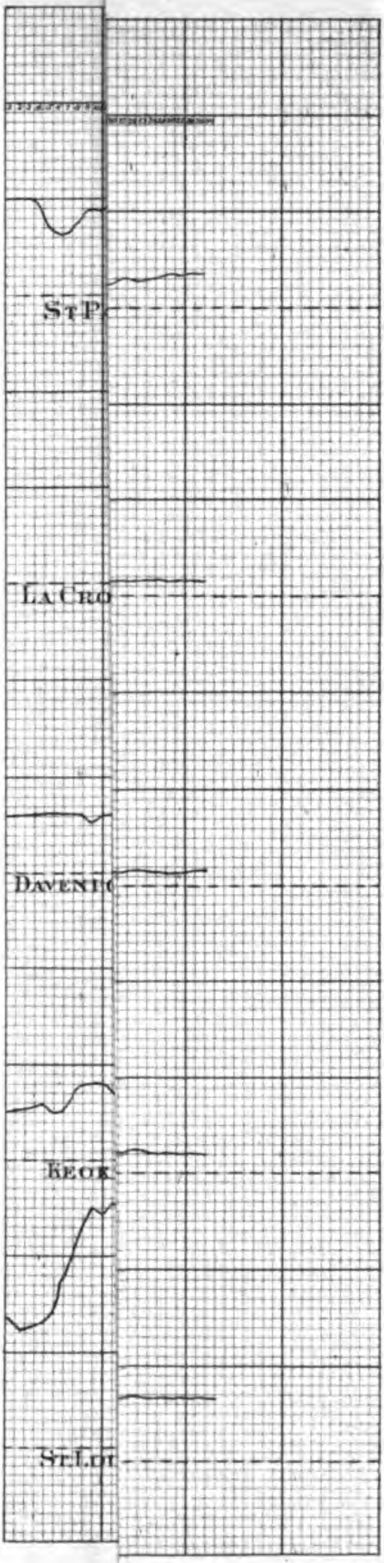
The zero of guage is at low-water mark of 1871. Depth of water from the river-b to the zero of guage is 8 feet. The navigable depth of water in the channel is 4 fe Usual depth on bars and shoals during low water is about 3 or 4 feet. From bed-ro to zero of the gauge at Saint Joe, as per the bridge measurement, is 50 feet.

SAINT LOUIS, MO.

The bench-mark is extreme low water of 1863, and high water of 1844. Range gauge between these two points is 41.39 feet. The gauge has stone foundation and located at the southeast corner of the Saint Louis elevator building.



N. PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D. C.



PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D.C.

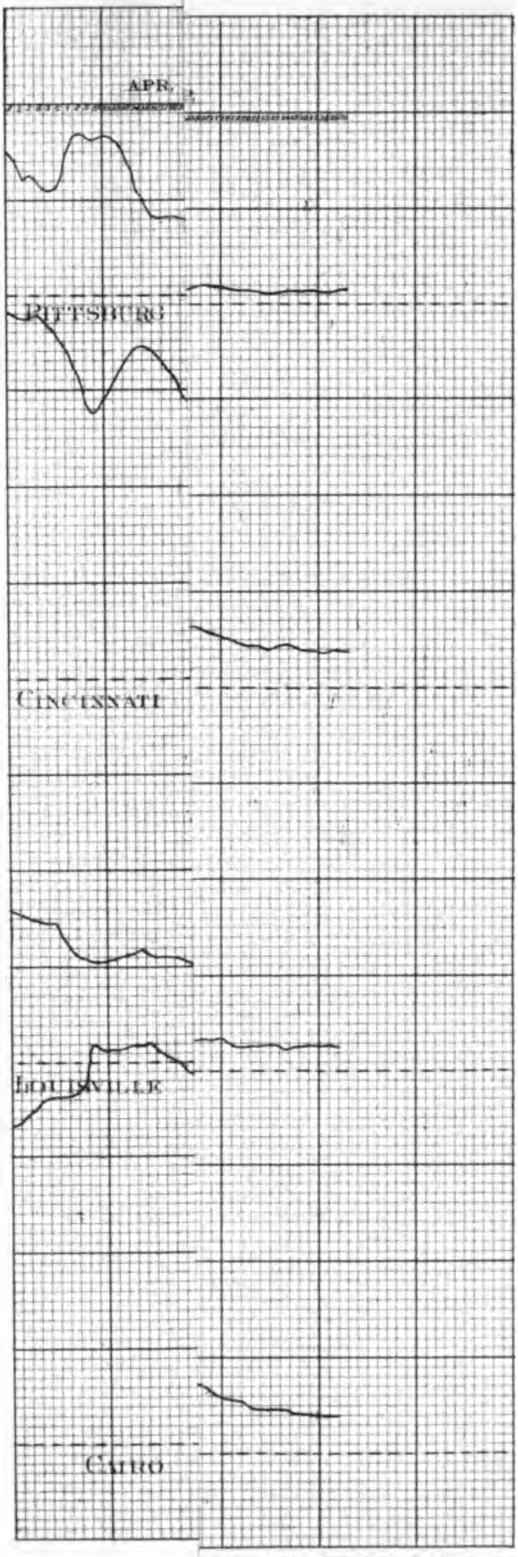
N. PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D.C.



N. PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D. C.

N. PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D. C.

SAINT PAUL, MINN.

The bench-mark is at the pier of the bridge and is marked at extreme low water of 1864. The daily report of river is the depth of water above that mark. The depth of water in the channel at extreme low water is 1 foot 11 inches. There is no high-water mark of any reliability.

VICKSBURGH, MISS.

The bench-mark is attached to one of the posts which supports tne elevator located on the levee between Crawford and South streets, and is low-water mark of 1871. From it all measurements are made and the zero of the gauge is adjusted to it. Extreme high-water mark of 1862 is 52.9 feet above the bench-mark. The river-bed is 50 feet 6 inches below, making the depth of water in the channel, when the river is at high-water mark, 103 feet 3 inches.

YANKTON, D. T.

The bed of river is the zero point of the gauge, and the actual depth of water in the channel is therefore reported.

LA CROSSE, WIS.

The zero of gauge is low-water mark of October 1, 1871, and is 2 feet 2¼ inches above the bed of the river. The gauge is attached to one of the piles of the bridge leading to North La Crosse.

OIL CITY, PA.

The "bench" is low water of some year when there was 12 inches of water in the channel. The zero of gauge corresponds with this point.

BOONEVILLE, MO.

Measurements are made from the bed of the river. Depth at high water of 1872, 12 feet; depth at low water, 2 feet 6 inches.

NEW GENEVA, PA.

The bench-mark (the zero of gauge) indicates 4 feet of water in the channel. The highest water occurred in April, 1852, when there was 40 feet of water in the channel.

LE CLAIRE, IOWA.

The gauge used here was built by the Pilot Association in 1865; its bottom (zero point) is at extreme low-water mark of 1864, which indicates 21 inches of water on the rapids.

DUBUQUE, IOWA.

The gauge used at this station is located at the foot of Seventh street. Its zero point is low-water mark of October, 1864, which is 21 feet 10 inches below the high-water mark of April 22, 1870. The average depth of water in the channel is 18 feet below the low-water mark of 1864.

PAPER 20.

REPORT OF INSTRUMENT-ROOM.

Number of instruments compared from October 1, 1872, to September 30, 1873.

Barometers	122
Thermometers	142
Hygrometers	42
Hygrodeiks	12
Maximum thermometers	39
Minimum thermometers	39
Anemometers	77
Aneroid barometers	6

These comparisons were carefully made by First Lieut. H. H. C. Dunwoody, acting signal-officer and assistant, and Sergts. George C. Schaeffer and D. C. Ralston, Signal-Service, United States Army.

Corrections for instrumental error of the several barometers have been comput uniformly from a series of fifty readings compared with a similar series of readings the standard barometer. When the result of these readings gave an error of mo than one-tenth of one inch, the instrument was regarded as unfit for use.

The thermometers have been compared with the standard at temperature varyi from that of melting ice to 130° Fahrenheit, the lower temperature being produced broken ice. For the indication of the higher temperature, the bulbs of the thermom ters were immersed in heated water.

In these comparisons a variation of one degree from the standard rendered the i strument unfit for use.

The following-named self-recording instruments have been in practical use in t instrument-room during the past year, and the records filed:

Hough's electrical printing barometer.
Hough's electrical recording barometer.
Wild's mechanical barometer.
Peelor's mechanical barometer.
Beck's aneroid barometer.
Photographic barometer.
Clum's aelleograph.
Hough's electrical meteorograph, (barometer, thermometer, and hygrometer.)
Wild's hygrometer and thermometer.
Photographic thermometers.
Gibbon's electrical recording anemometer.
Gibbon's electrical recording anemometer and anemoscope.
Beck's mechanical recording anemometer and anemoscope.
Wild's mechanical anemometer, anemoscope, and rain-gauge.
Draper's mechanical anemometer for velocity.
Draper's mechanical anemometer for pressure.
Draper's mechanical anemoscope.
Draper's mechanical rain-gauge.
Beckley's mechanical rain-gauge.
Gibbon's electrical recording tide-gauge.
Dunwoody's electrical tide-gauge.

Two glass cases, in which are represented the different atmospheric phenomena, ha been constructed by Private P. A. Monnet, Signal-Service, United States Army. Bo cases contain specimens of clouds arranged in the style of a panorama. The small case gives only the principal outlines of the objects, and may be considered as a sh synopsis of that branch of meteorology. The larger case is more particularly adapt for nephelegraphic studies, each type of cloud being therein exhibited in its most ess tial character, and surrounded with its principal derivatives. The broader forms a those above them are separate types; whereas the two lower strata, being the terr trial range, correspond to combined meteors, viz: aqueous, aerial, and luminous. So phenomena of the last class, like haze, auroras, coloration at sunrise and sunset, c be produced at pleasure by optical attachments external to the case. The chief obj aimed at in both styles of representation is to trace the effects of atmospheric ag cies on aqueous vapor.

PAPER 21.

CORRESPONDENCE IN REFERENCE TO THE CO-OPERATION OF T POST-OFFICE AND WAR DEPARTMENTS IN THE DISTRIBUTION WEATHER-REPORTS.

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGNAL-OFFICER,
DIVISION OF TELEGRAMS AND REPORTS
FOR THE BENEFIT OF COMMERCE AND AGRICULTURE,
Washington, D. C., December 7, 1872

SIR: I have the honor to request that instructions may issue to the postmasters the post-offices named in the accompanying list A, herewith, to display daily and stantly upon their receipt by mail, upon bulletin-boards, which will be furnished (if permitted by the Postmaster-General) from this office, the reports as to the proba condition of the weather in the sections in which these offices are located, which t office will furnish by mail daily in printed form, and addressed to the postmast named respectively. Under section 6 of the act of Congress entitled "An act to rev consolidate, and amend the statutes relating to the Post-Office Department," appro

, 1872, the request of the honorable Postmaster-General that this publication be y the postmasters, or others in his service, as being for the public good, would have the effect of an order; but should there be question on this point, there none that most of the postmasters interested would gladly perform the duty as public good, and one reflecting credit upon the Department in which they

e Postmaster-General himself, whose good-will to this Bureau has been so often th such benefit to the Department evidenced, the Chief Signal-Officer does not ecessary to urge at length reasons for requesting his valuable co-operation. It ient to say that the plan suggested seems to offer a more immediate and extenthod of reaching the whole interior and agricultural populations of the United with information in which each citizen has an interest, than any hitherto put in ny country in the world.

tion is respectfully invited to the accompanying memorandum of the plan of tion.

am, sir, very respectfully, your obedient servant,

ALBERT J. MYER,
Brigadier-General and Chief Signal-Officer of the Army.

Ion. POSTMASTER-GENERAL.
rough the Hon. Secretary of War.)

PLAN OF WORK.

proposed to divide the territory east of the Mississippi River into districts of vo-hundred miles in diameter, each district having a distributing point at or center, from which two copies of the reports will be mailed daily to all postccessible by rail or mail-coach by 6 p. m. each day. At each office the posts to post one copy of each report, as soon as received, in a frame to be furn- the Signal-Office, which frame will be put up in a conspicuous part of the here it can be seen and the bulletins read by the public without difficulty.

cond copy is intended for the personal use of the postmaster, and may be dis- in the manner he thinks best calculated to diffuse the information it contains.

rt herewith illustrates the proposed form of districting.

MEMORANDUM.

tent of the co-operation required of the Post-Office Department is the transaily by mail of one additional letter to each post-office named in the schedules, putting up daily at such offices one copy of the bulletins furnished by the ffice.

WAR DEPARTMENT,
Washington City, December 9, 1872.

have the honor to inclose herewith a communication from the Chief Sigr of the Army, relative to distribution of the daily weather-reports, and to he co-operation of your Department in the mode indicated by him, if conith your views. The subject is one of public interest, and the plan appears f effecting a public good.

ry respectfully, your obedient servant,

WM. W. BELKNAP,
Secretary of War.

n. POSTMASTER-GENERAL.

POST-OFFICE DEPARTMENT,
Washington, D. C., December 11, 1872.

have the honor to acknowledge the receipt of your letter of the 9th instant a communication from the Chief Signal-Officer of the Army, with schedules for the co-operation of the Post-Office and War Departments in distributing weather-reports throughout the agricultural districts of the United States by rail or mail-coach, by 6 p. m. each day, from certain designated distribnts.

ly approve of the plan proposed by General Myer for extending to the agriections of the country the benefit of the information contained in the daily eports from the Signal-Office, and have issued an order under date of 9th instant, a copy of which is inclosed herewith, instructing all postmasters receivi these reports by mail to post them immediately in the frames supplied for that purpo by the Signal-Office.

Any further assistance that may be desired from this Department will be most che fully given.

I am, very respectfully, your obedient servant,

JNO. A. J. CRESWELL,
Postmaster-General.

Hon. WM. W. BELKNAP,
Secretary of War.

POST-OFFICE DEPARTMENT,
Washington, D. C., December 10, 1872.

Arrangements have been made between the Post-Office and War Departments i which one or more of the daily weather-reports issued by the signal-office will furnished daily to all the post-offices that can be reached from the several points distribution daily by mail. As these reports are designed for the benefit of the ag cultural as well as the commercial interests of the country, the Postmaster-General i structs all postmasters receiving them to post them *immediately* in the frames suppli for this purpose by the signal-office.

PAPER 26.

MONTHLY WEATHER-REVIEW, OCTOBER, 1872.

STORMS.

The progress over the country of thirteen storm-centers has, during the month, been raced upon the War Department weather-maps, Signal Service, United States Army. he most severe of these storms was that which, from the 21st to the 27th, traveled om the Gulf northeastward over the South Atlantic and Middle States, and thence stward over southern New England into the Atlantic, attended throughout its course y heavy rains and brisk to high winds, increasing at times to gales. These rains ere particularly heavy in Northeastern Florida and Southeastern Virginia, over 6 ches of water falling during the storm at Jacksonville, and nearly 7¼ inches at Norlk. Of the remainder of these disturbances nine pursued an irregular eastward ourse from the northwest over the lake region into Canada or New York or New England to Brunswick or Nova Scotia; one moved from Texas eastward into the Gulf, here it disappeared; one nearly northward from off Cape Cod across Maine to New runswick, and one from Kansas and Nebraska eastward over the Ohio Valley to Viriinia.

RAIN-FALL.

The returns from the signal-service stations show that an excess of rain over the mean for the month has fallen on the Atlantic coast, except in Maine and Southeastern Connecticut, and throughout the Middle States and lower lake region, excepting westtern Lake Erie. This surplus amounts to 4.32 inches at Jacksonville, Fla., 4.89 at Rochester, and 7.07 at Norfolk, but is less at other stations in the sections, varying from 1 to 2 inches. A slight excess has also fallen in the western portions of Tennessee and Minnesota, and eastern parts of Nebraska and Kansas. There has been a deficiency of about an inch in northern New England, interior portions of South Carolina and Georgia and throughout the Gulf States, excepting Florida, while in Central and Eastern Tennessee, Western Kentucky, the Upper Mississippi Valley and over the upper lake region the figures show a general deficiency of about 2 inches. The precipitation has been very slight at the Rocky Mountain stations and on the Pacific coast, apparently less than the mean for October.

TEMPERATURE.

The mean temperatures for this month show but little variation from the means for October at most of the signal-service stations. At the Rocky Mountains, on the Pacific, and western Gulf coasts, in Eastern Iowa and Southern Wisconsin, and throughout the Atlantic States, from Florida to Rhode Island, temperatures slightly cooler than usual have been experienced, the variation below the mean for the month being greatest at Milwaukee and on the coast of Georgia and the Carolinas where it amounts to about 3°. In all other sections the temperature has been slightly above the average for October. The month has, however, been much cooler than October, 1871, everywhere in the Mississippi Valley and eastward, this difference of the mean temperature being greatest in Florida, Georgia, and from the Ohio Valley to the lower lakes and southern portion of the upper lake region, amounting in these sections to from 3° to 6°

MONTHLY WEATHER-REVIEW, NOVEMBER, 1872.

STORMS.

During this month twenty-four storm-centers have traversed various parts of th country east of the Rocky Mountains. Fifteen of these disturbances have pursued a irregular eastward course from the northwest over the lake region to Canada, or, crossing the Saint Lawrence Valley, have traveled eastward over Maine and New Brunswick two have moved from the Upper Mississippi Valley eastward to Virginia, and thenc along the coast to New England; four have crossed the country diagonally from the southwest to New England and the eastern British provinces; one from Texas across the northern portion of the Gulf to Florida; and two, which were probably central at som distance from the coast, have been felt along the Atlantic sea-board.

Destructive gales have attended the progress of many of these storm-centers, particularly over the upper lake region, in the Saint Lawrence Valley, and on the middle and east Atlantic coasts. Their approach has, however, been heralded by the display during the month of sixty-eight cautionary-signals at the lake stations — fourteen on the Atlantic coast and six on the Gulf.

RAIN-FALL.

Notwithstanding the number of storms which have visited the country during th month, the returns from the signal-service stations show that the precipitation ha been generally less than the mean for November at the Rocky Mountain stations, i Florida, the Southwest, (except Southeastern Texas and Southern Louisiana,) the Northwest, the Ohio Valley, and throughout the lake region. The figures show this deficienc to be greatest over the section of country extending from Kansas eastward to Kentuck and Ohio, averaging about 2 inches, but amounting to over 4 inches in Central Indiana An excess of rain has fallen in the Carolinas, Georgia, Eastern Tennessee, Central Alabama, Southern Louisiana, and Southeastern Texas, while about the average quantitie are reported from the Middle and Eastern States, except the western portions of Pennsylvania and New York, where the amounts are below the mean.

TEMPERATURE.

The mean temperatures for the month at the various signal-service stations sho that the month has been colder than usual everywhere from the Atlantic to the Rock Mountains, excepting, perhaps, in Montana. Areas of high barometric pressure, attended by low temperatures for the season, have, in several instances, followed clo after the storm-centers, causing cold "northers" in the Southern States, and fierc cold, westerly gales over the Northwest and upper lake region. The variation of th

nperature below the mean for November has, consequently, been greatest in ions, amounting to from 3° to 8°. Compared with November of last year lower ures have prevailed everywhere east of the Rocky Mountains, except in New New York, New Jersey, and Eastern Pennsylvania. Thus the mean temperature than the same for November, 1871, by 3°.1 at New London, 3°.3 at Portland, 8°.7 at Burlington, Vt., but lower by 5°.1 at Savannah, 7°.4 at Jacksonville, at Mobile, 7°.6 at Cincinnati, 4° at Saint Paul, and 4°.8 at Escanaba, Mich.

MONTHLY WEATHER-REVIEW, DECEMBER, 1872,

STORMS.

this month no less than twenty-seven storm-centers have been traced in their ver various parts of the country upon the War Department weather-maps, vice, United States Army. Two of these storms have apparently traveled cross the country from the Pacific coast, but the paths of the remainder are nfined to the country east of the Rocky Mountains, and are about equally tween the two favorite winter-routes of these disturbances, the one from the eastward over the lake region and northern New England to the eastern ovinces, and the other from the southwest northeastward to the Middle New England, or eastward along the Gulf coast, thence following the trend ntic coast northeastward toward Nova Scotia. The usual attending high gales of the winter storms have been experienced in nearly all parts of the ut their approach has been announced by the display of forty-two cautionary- the lake ports, thirty-two on the Atlantic coast, and three on the Gulf.

RAIN-FALL.

rns from the signal-service stations show that an excess of rain, amounting o 5 inches above the mean rain-falls for December, has, during the month, exas, Louisiana, and Western Mississippi. A surplus, varying from 1.12 2.69 inches, has also fallen in Southern Virginia, North Carolina, Eastern interior portions of South Carolina and Georgia, and in Northeastern n all other sections east of the Rocky Mountains (excepting at New London, Leavenworth, and Breckenridge, which exhibit amounts slightly above the figures show that the fall of rain and snow has been less than the average ber. This deficiency is comparatively small for New England, the Middle lower lake region, but is large in Western Tennessee, the Ohio and Upper Valleys, and over the country adjacent to Lakes Michigan and Superior, the on having been scarcely one-fourth as much as the average for the month ations in these sections.

TEMPERATURE.

temperatures for the month at the signal-service stations compared with the eratures for December, as ascertained by a long series of observations, show nth has been much colder than usual everywhere east of the Rocky Mount- excess of cold amounts to from 5° to 7° at stations in all parts of the coun- Chicago, Milwaukee, Leavenworth, Breckenridge, and Rochester it amounts Much colder weather has prevailed than in December, 1871, in all sections erritories, except from Virginia to Southern New Jersey, and from Nebraska Illinois, where the temperatures have been about the same. This unusually her may be attributed to the large number of areas of high barometer, or heric waves, which, with their attending low temperatures, have rolled ountry from west to east. No less than fifteen of these areas of high press- en traced upon the weather-maps for this month, while during the corre- nth last year only nine made their appearance.

MONTHLY WEATHER-REVIEW, JANUARY, 1873.

STORMS.

past month the progress of twelve storm-centers has been traced on the s of the signal-service. Of these, three have crossed the country in a d direction from Texas to New England and the British provinces; five have moved from the extreme northwest eastward over the lakes into Canada or Ne England; one from Manitoba over Lake Superior into Canada; two northeastward u the Atlantic coast to the Eastern States and Nova Scotia or Canada; and one has pr gressed eastward through the Gulf States, and thence northeastward up the coast.

Of these storms the most severe have been that of the 7th and 8th in the north west, and that which from the 21st to the 24th crossed the country from Texas to Nov Scotia. The westerly winds closely following the center of the former increased t strong gales, which, with heavy snow and temperatures far below zero, served to rend it one of the most terrific which has visited that section for many years. The latt (that of the 21st) was very extensive in its effects, as during its course nearly the whol country east of the Rocky Mountains was reached by its rain or snow-belts. Its north easterly gales were felt with most severity from Lake Michigan to Lake Erie, and heav snows fell from Kansas and Missouri northeastward to Canada.

Twenty-four cautionary-signals were displayed during the month at points on th middle and east Atlantic coasts, and two on the Gulf coast.

RAIN-FALL.

The monthly rain-fall returns for January from the signal-service stations show tha there has been in general a deficiency on the Pacific coast; but east of the Rocky Mountains an excess of rain and snow. This latter excess is most decided in Missouri, Nev Jersey, and Connecticut. A small region of deficiency also appears to extend ove Kentucky, Tennessee, Mississippi, and Alabama

TEMPERATURE.

The mean temperatures for January, as given by the signal-service reports, show tha over the country east of the Rocky Mountains the weather has been generally colde than usual. This difference is greatest in the northwestern section, being in Michiga and Northern Ohio about 6° below the mean temperature for the month, and from Wi consin and Minnesota to Kansas ranging from 7° to 12° lower than usual. In the lowe Mississippi Valley, and also Northwestern New York, the average temperatures hav been from 5° to 6° lower than might have been anticipated, while this difference i New England and throughout the Middle States generally has been from 2° to 4°. I the South Atlantic States about the mean temperatures have prevailed, except in Northern Florida, where they are shown to be somewhat lower, as also in the Gulf States.

MONTHLY WEATHER-REVIEW, FEBRUARY, 1873.

STORMS.

During this month ten different storms have crossed portions of the country east c the Rocky Mountains. The paths of their centers have, approximately, been trace upon the War Department weather-maps, Signal Service, United States Army.

That of February 3d and 4th passed over Nebraska, Iowa, Wisconsin, and Michiga into Canada, accompanied by rain, at places heavy, from Texas to Iowa and eastwar to the middle Atlantic coast, but by generally light snow or rain thence northwar over New England and the lakes, and by brisk and high winds over the lake regio westerly winds being most severe; thunder-storm reported from Knoxville, 4th.

February 5, 6, 7, and 8.—Over Gulf and South Atlantic States and thence northeastwar off the middle and east Atlantic coasts and over Nova Scotia, accompanied by heav rain to Massachusetts, and by fresh and brisk winds over Gulf coast, and brisk an high over Atlantic coast, easterly to northerly winds most severe.

February 6 and 7.—Eastward over Northern Minnesota and Lake Superior into Canad accompanied by areas of very light snow and brisk and high winds over the lake regio southwesterly to northwesterly being most severe.

February 9, 10, and 11.—Eastward from Dakota over Minnesota, Wisconsin, and Michigan into Canada, accompanied by generally light rain or snow from Missouri, Tennessee, and Virginia northward and northeastward, and by brisk and high wind southeasterly to southwesterly being most severe.

February 11 and 12.—Northeastward over Southern States and beyond middle Atlanti coast, accompanied by heavy rain from Kentucky to Southern New Jersey and southward to Gulf, but snow from Ohio to lower lakes and Connecticut, and by brisk t high southerly to westerly winds over western Gulf coast, brisk and high southwesterly over South Atlantic States, and brisk and high easterly to northerly from Virgini to Massachusetts; thunder-storm reported from Knoxville, 12th; storm very sever from Cape Cod southward.

February 15, 16, and 17.—Northeastward from Texas over the Ohio Valley; thence eastward over and beyond middle Atlantic coast, accompanied by rain, generally heavy

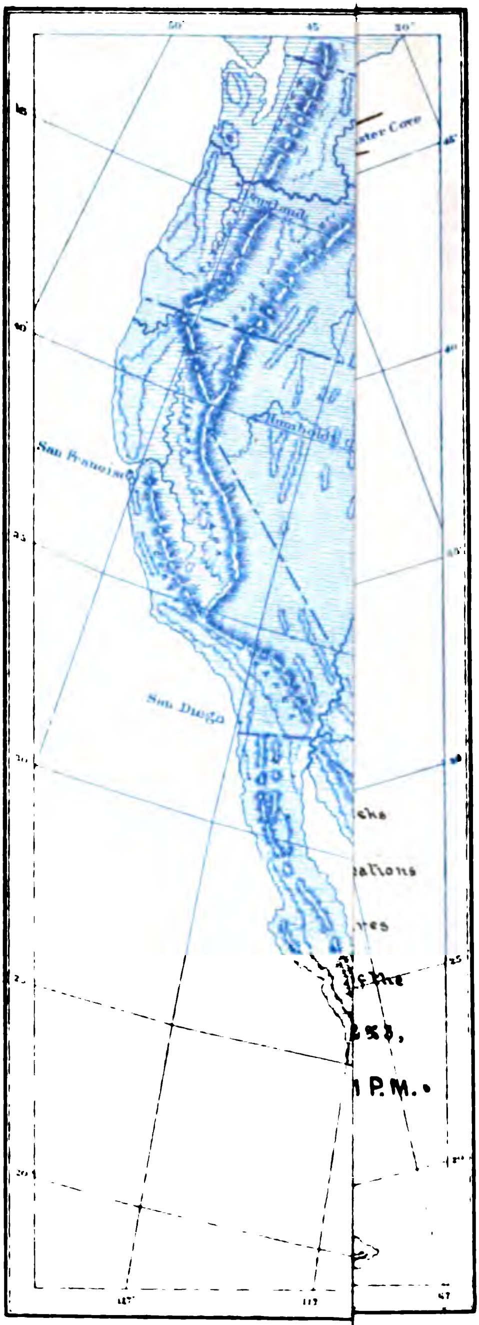
5



N. PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D.C.

a to Connecticut and southward to Gulf, but areas of light rain and snow orthward to Maine and the lakes, and by brisk and high winds over western Atlantic coasts; severe thunder-storm reported from Memphis on 15th.

y 17 and 18.—Northeastward from Dakota over Minnesota and Lake Supe-Canada, accompanied by light rain and snow and by brisk aud high winds, by low temperature.

y 20 and 21.—One over the Southern States, and thence northeast along the h fresh and brisk southerly winds over west Gulf, veering to high northerly; therly over south Atlantic coast, and brisk and high northeasterly to north-over middle and east Atlantic coasts; other northeastward over Missouri; nd Michigan into Canada with brisk and high winds; the two accompanied rain over the country east of the Rocky Mountains, except snow from Iowa esota eastward over the Lake region and Northern New England.

y 26 and 27.—From Nebraska and Missouri northeastward over Michigan into ccompanied by brisk and high winds; at the same time a diminished pressure as eastward over Gulf and South Atlantic States, and thence northeast off d east Atlantic coasts with brisk and high winds; the two accompanied by Missouri to Northern Louisiana and eastward to Virginia and south Atlantic by snow thence northward over Northwest, lakes, and Southern New England. hree cautionary-signals were displayed at the signal-service stations on the oast and two on the Gulf.

RAIN-FALL.

ared with the means of a number of years for the month, the rain-fall returns ignal-service stations show a deficiency over the lake region, Northwest, s, Southern Georgia and South Carolina, New York, and Northern New En-an excess from the northern portions of Alabama, Georgia, and South Caro-nessee, Southern Indiana and Ohio, Pennsylvania and Southern New Jersey, t marked over Tennessee, also an excess over Rhode Island and Eastern etts and Connecticut.

TEMPERATURE.

e mean temperature for the month, taken from the signal-service reports red with that for a number of years at the same stations, or close by, it is at the former has been somewhat higher over the Gulf States, eastern por-ntucky and Tennessee, and southern portions of Ohio and Indiana, by from t otherwise east of the Rocky Mountains lower by from 1° to 8°, being over New York, Michigan, Wisconsin, and Minnesota.

MONTHLY WEATHER-REVIEW, MARCH, 1873.

STORMS.

is month eleven storms have crossed portions of the country east of the tains. The paths of their centers have approximately been traced upon partment weather-maps, Signal Service, United States Army.

r of that of March 1, 2, 3, and 4, passed from Texas over the Gulf States as l pressure on the 1st and 2d, accompanied by heavy rains and brisk winds, sed to high northerly along the Texas coast on the 1st and 2d; thence rd along the Atlantic coast, followed by brisk and high northerly to west-ver South Atlantic and Middle States, but brisk and high northeasterly, orthwesterly over east Atlantic coast, and accompanied by heavy rain ove tlantic States, but by generally light snow over the Middle and Eastern vas followed on the 2d and 3d by very cold weatherand brisk and high north-ds from the northwest and upper lakes to the Gulf, which, on the 3d and l eastward over the Atlantic coast; on the 3d, thermometer readings from ees below zero were reported from Minnesota.

and 8.—Nearly due east over Dakota, Minnesota, and Upper Michigan into eded by rain and brisk to high easterly and southerly winds from ippi Valley and Tennessee to the lakes and northern portions of the Mid-ern States; followed by occasional snow over the lakes and Minnesota, and high westerly winds from the Missouri Valley eastward over the Mid-rn States, increasing to gales over the lakes.

and 10.—From Southern Dakota, a little south of east over Iowa, Illinois, as a diminished pressure, accompanied by fresh and brisk winds only; st over Ohio, Pennsylvania, and beyond Cape Cod increasing in severity, d high winds and generally light rain or snow from Tennessee and North hio, and thence to Maine.

March 10 and 11.—From Dakota over Minnesota and Lake Superior into Canada an continuing north of the Saint Lawrence Valley; preceded by brisk and high easterly t southerly winds, and followed by brisk and high westerly to northerly winds; accom panied by areas of light rain or snow from Missouri to Minnesota and Lakes Superio and Huron, but thence eastward over the Middle and Eastern States becoming genera and at places heavy.

March 14, 15, and 16.—Eastward from Nebraska and Southern Dakota over the lak region and apparently the eastern British provinces; accompanied by rain from Nortl ern Louisiana to New England and north of this line to the lakes and northwest; pre ceded by brisk to high easterly and southerly winds, and followed by brisk and hig northerly to westerly, increasing at places to gales.

March 17 and 18.—Eastward over Wisconsin, the lakes, New York, and New England accompanied by brisk winds and rain, generally light, from Tennessee and Virgini northwest, north, and northeastward.

March 18, 19, 20, and 21.—Eastward over Dakota to lower Michigan apparently as diminished pressure, but then developing into two; one passing over Virginia, an thence northeastward along the coast; the other north of the lower lakes and over th northern portion of New England; accompanied by rain and snow over the entir country east of the Rocky Mountains, also by brisk and high winds, the easterly havin probably been the most severe, increasing to gales.

March 22 and 23.—From Dakota over the upper lakes into Canada, and thence ove Northern Maine, accompanied by occasionally light snow and brisk winds which a places increased to northeast gales.

March 23, 24, 25, 56, and 27.—Northeastward over the Ohio Valley, and developin into two; one over the lower lakes, down the Saint Lawrence Valley, the other over th middle and east Atlantic coasts and New Brunswick; accompanied by heavy rain ove the entire country east of the Rocky Mountains, except that from Northern New En land westward over the lakes to the northwest it was snow, and by brisk and hig winds, which at places increased to gales, the north and west having been most sever except at Quebec, where a very severe northeast gale prevailed on the afternoon of th 26th; this storm was followed by a severe "norther" in Texas on the 25th.

March 28, 29, and 30.—From Southern Dakota eastward over the lakes, New Yor and New England; accompanied by areas of light rain or snow over the northwest an upper lakes, but by rain, generally very heavy, from the Lower Mississippi and Ohi Valleys and lower lakes to the Atlantic coast, also by brisk and high winds; on its pa sage over the Middle and Eastern States it increased in severity, and the winds t southerly gales on the coast, shifting later to northwest; it has undoubtedly been th most severe storm of the month, and the barometric depression most remarkable, th lowest reading having been 28.80 inches at Burlington, Vt., 11 p. m. on the 29th.

March 30 and 31.—Over the northwest lakes and New England; accompanied b generally very light rain or snow from the northwest eastward over the lake regio Ohio Valley, and Middle and New England States, and by brisk winds, increasing o casionally to high.

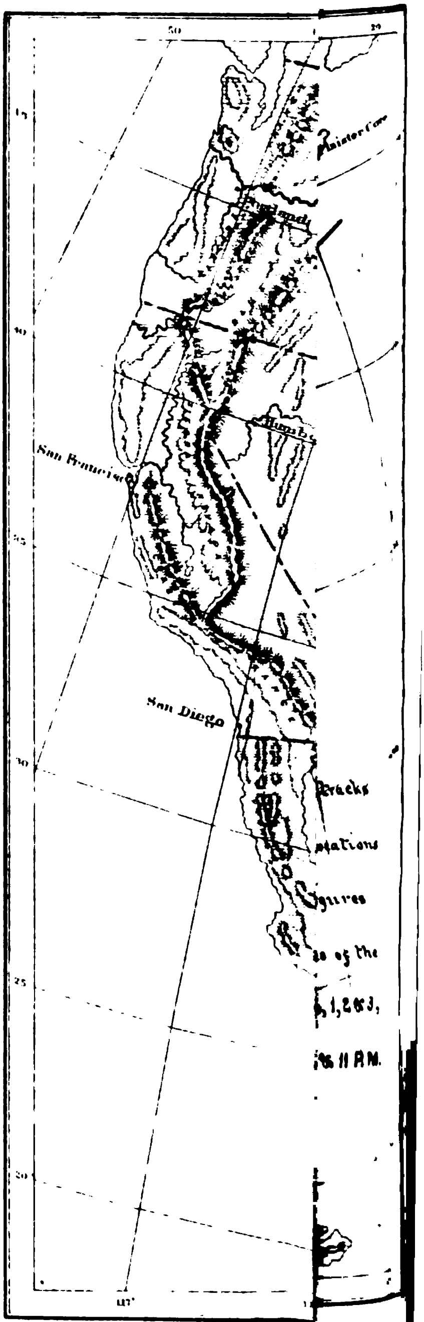
During the month ninety-five cautionary-signals were displayed at the signal-servic stations on the Atlantic coast and five on the Gulf.

RAIN-FALL.

As compared with the means of a number of years for the month, the rain-fall return from the signal-service stations show a general deficiency at the stations east of th Rocky Mountains and at San Francisco, from 0.05 to 4.00 inches, except over the south ern portion of New England, northern and western portions of the Middle State Southeastern Louisiana, Jacksonville, Florida, and Eastern Tennessee and Kansa where the excess varies from 0.10 to 4.86 inches.

TEMPERATURE.

The mean temperature for the month, as taken from the signal-service reports, at a stations east of the Rocky Mountains is higher, from 1° to 10°, than the same for last yea except for Jacksonville and Key West, Fla., which is slightly lower, at latter 1° 5 By comparing same of this year with that for a number of years at the same station or at others close by, it is observed that the former is from 1° to 5° lower over th Southern, Middle, and New England States, Ohio and southern portions of Michiga Illinois and Missouri, but northwest of this region to Minnesota, Iowa, and Nebrask it varies from 4° above to 5° below. During the month the weather has therefore bee generally colder than usual, but warmer than March of last year, except in Utah, whe it has been somewhat colder this than last, and at San Francisco, where there has a parently not been any change.



N. PETERS, PHOTO LITHOGRAPHER, WASHINGTON D.C.

MONTHLY WEATHER-REVIEW, APRIL, 1873.

STORMS.

this month seven storms have been felt over a portion, or nearly the whole,
untry east of the Rocky Mountains. The paths of their centers have, approxi-
een traced upon the War Department weather-maps, Signal Service, United
my.

ter of that of April 1 and 2 passed over Missouri, Illinois, and Michigan into
ending out a minor disturbance over the middle Atlantic coast, accompanied
o high winds and heavy rain in all the States east of the Rocky Mountains,
at it was partly snow and sleet over northern New England, the lake region,
orthwest; it was felt as a very severe storm from northern Texas to the
northwest.

4, 5, 6, and 7.—Over Nebraska, Iowa, Missouri, Illinois, and lower Michigan
la, accompanied by brisk and occasionally high winds, and sending out several
turbances to the eastward; also by rain-areas, generally light, from the Mis-
Ohio Valleys and east and middle Atlantic coasts to the lakes and Saint
Valley, except over the lake region, where it was partly snow.

8, 9, and 10.—Over Texas, Arkansas, Illinois, and Lake Michigan into Can-
ng out a branch over the Ohio Valley, middle Atlantic coast and to the south
ngland, both accompanied by brisk and high winds; also by rain, generally
m Texas to Minnesota and eastward to the Atlantic coast, except that it was
w over the upper lakes and northwest; it was followed by a severe "norther"
n the 8th.

, 11, 12, and 13.—Over the northwest, and developed into two; one passing
ower lakes into Canada, accompanied by brisk and occasionally high winds
n or snow from Missouri and Kentucky to the lakes; the other over the Ohio
middle Atlantic coast, and thence slowly northeastward, preceded by severe
rly gales, rain, sleet, and snow from Chesapeake Bay to Nova Scotia, New
, and the lower Saint Lawrence Valley.

, 14, 15, 16, 17, 18, and 19.—Eastward over Wyoming, Nebraska, and Kan-
a and Missouri; then diminishing in intensity and breaking up into, and
t to the eastward over the lower lakes, several minor disturbances, and
the middle Atlantic coast, moving thence very slowly on the 17th, 18th, and
the New England coast to Nova Scotia and New Brunswick as quite a severe
vas accompanied by rain, generally heavy, over the entire country east of
Mountains, except that it was partly snow over northern New England, the
and the northwest; on the 12th, 13th, 14th, and 15th it was felt as a very se-
of rain, sleet, and snow in Wyoming, Dakota, Nebraska, and Minnesota, on
on and night of the 14th and morning of the 15th as a very severe "norther"
east of the Mississippi numerous minor disturbances were left, producing
r snow.

22, and 23.—Southeastward over Dakota, the Lower Missouri and Lower
s, and beyond the Carolinas; attended by fresh to very brisk winds, and by
nerally light rain or snow from Missouri, Tennessee, and North Carolina to
the lakes, and Massachusetts, and followed by a severe "norther" in Indian
the 22d, and in Texas on the 23d and 24th.

28, and 29.—Over Indian Territory to Kentucky, then apparently develop-
d disappearing to the eastward as several minor disturbances; accom-
esh and brisk winds and rain from the interior of the Gulf States to the
lassachusetts, which was generally heavy over the interior and along the
st.

RAIN-FALL.

ns for the month from the signal-service stations show that there has been
rain and snow over southern New England, the lower lake region, from
Southern Michigan to Kansas, Iowa, and Southern Minnesota, and over
bama and Southeastern Georgia, varying from 0.65 inch to 3.06 inches, being
llinois and Missouri. Elsewhere east of the Rocky Mountains there has
iency of from 0.07 inch to 3.87 inches, being most marked in the western

compared with that of last year is lower at the Rocky Mountain stations,
nce eastward, 0.5° to 8°; the difference being greatest over the Northwest
lle States.

MONTHLY WEATHER-REVIEW, MAY, 1873.

STORMS.

During this month ten storms have traversed the country east of the Rocky Mountains. The accompanying map shows the paths of their centers:

I. *May* 1, 2, and 3.—Apparently originating on the last day of April in the Rocky Mountains, the center of this storm progressed eastward over Kansas, Missouri, Northern Indiana, Southern Michigan, and Lake Erie, moving thence southeastward over Pennsylvania and Maryland to the Atlantic, sending out a branch on the 2d over Ohio, Virginia, Chesapeake Bay, and thence off the coast. Its passage was attended by heavy rains and brisk and high winds from the Mississippi to the Atlantic, sleet and snow falling in New England.

II. *May* 4 to 8.—Appearing first in Southern Texas, this storm moved slowly northeastward over Arkansas, Missouri, Illinois, Southern Michigan, and Lake Huron. The highest winds during its passage were experienced on the coast of Texas, the lower lakes, and the middle Atlantic coast.

III. *May* 8 and 9.—Developed among the mountains of North Carolina and moved northeastward along the middle Atlantic coast, accompanied by heavy rains and high winds.

IV. *May* 8, 9, and 10.—Appeared first in Kansas and moved eastward over Missouri and thence rapidly northeastward over Illinois, Indiana, Michigan, and southern Lake Huron into Canada. Heavy rains fell in Northern Illinois and Eastern Iowa, and a belt of lighter rains and brisk winds, from four hundred miles to eight hundred miles in width, attended its progress.

V. *May* 10, 11, and 12,—Like III, this storm seemed to develop among the mountains of North Carolina, passing northeastward over Virginia, eastward over Chesapeake Bay, and again northeastward along the coast to New Brunswick.

VI. *May* 12 and 13.—Traveled from Minnesota very rapidly eastward over the lakes, Saint Lawrence Valley and northern New England to Nova Scotia, causing light rains and high winds throughout its course.

VII. *May* 13, 14, and 15.—From the plains of Kansas and Indian Territory this storm-center moved eastward over Southern Missouri, southeastward into Alabama, and then again eastward off the coast, rapidly diminishing in intensity after crossing the Mississippi. Considerable rain fell in all the Southern States, except Texas, but no dangerous winds were reported.

VIII. *May* 18, 19, and 20.—Developing in the southwestern plains this depression traveled rather slowly northeastward from the Indian Territory over Lakes Michigan and Huron into Canada, attended by rain-belts and fresh to brisk winds throughout the lake region and western and northwestern sections of the country.

IX. *May* 21 to 24.—From Montana this disturbance moved slowly eastward over Dakota, crossing, with somewhat increased velocity, Minnesota, the upper lakes, the Saint Lawrence Valley, Maine, and Nova Scotia, causing, by its slow progress, several days of cloudy and rainy weather over the entire northern portion of the country. It was during its passage over the Northwest that the terrible and destructive tornado swept through Iowa.

X. Two depressions, one slowly descending from the Upper Missouri Valley, the other moving northward over Kansas and Nebraska, seemed to unite in Southern Dakota to form this storm-center. From Dakota it moved southeastward into Iowa, northeastward to Lake Superior, and thence nearly due east over the Saint Lawrence Valley, Maine, and New Brunswick. Its rain-belts reached nearly the whole country east of the Mississippi, and brisk winds, increasing occasionally to high, were experienced throughout the northern sections.

TEMPERATURE.

The temperatures for the last month were generally lower than for May, 1872, the chief exceptions being Key West, Oswego, and Grand Haven. As compared with the mean May temperatures of a series of years, the thermometric figures for May, 1873 show excess of warmth over northern Lake Michigan, Northern Michigan, Lake Huron, Southern Ohio, Kentucky, Tennessee, and Eastern Massachusetts, but a deficiency of temperature in Kansas, Missouri, Iowa, Minnesota, Wisconsin, Indiana, Illinois, and the Gulf States, Florida, and Southeastern Georgia, and generally throughout the Atlantic States and the lower lake region. The regions of minimum rain-fall and thermometric maxima nearly correspond.

RAIN-FALL.

As compared with the mean May rain-falls, the rain-fall returns of last May show deficiencies in the northern and western parts of Lake Superior, Lake Michigan, and in the entire country stretching from the Saint Lawrence Valley to Maine, and thence over the lower lakes, Western New York, and Western Pennsylvania, West Virginia

Central Indiana, and Southeastern Illinois. Excess of rain occurred in Iowa, Mis- , Eastern Kansas, East Tennessee, and also along the Atlantic sea-board, except Portland, Me., and Savannah, Ga., and a very great excess, from 2.00 to 14.58 s, over the Gulf States.

RIVERS.

e river reports for the month show a slight decline in the Red and Missouri Rivers the beginning to the middle of the month, after which a decided rise occurs until nd. The Arkansas rose slowly at Little Rock until the 23d, after which it subsided y. The Mississippi has alternately risen and fallen; at Saint Paul the water was lower on the 19th than on the 31st, at which dates, respectively, it was lowest ighest; at Saint Louis the lowest and highest extremes occurred, respectively, ie 3d and 31st, the difference being 6 feet and 3 inches. At Cairo the river lowest on the 28th and highest on the 16th, the extremes being about 13 feet. emphis the difference between the highest and lowest water for the month has about 9 feet, having been highest on the 22d and lowest on the 28th. A very rise occurred on the Cumberland at Nashville from the 1st to the 4th, after which ater gradually subsided until the 21st, rising again until the 27th, and then again g until the 31st.

Ohio was affected by a great swell which traveled from Pittsburgh on the 4th ansville on the 14th; since then it has fallen almost uninterruptedly. The differ- etween the highest and lowest water has been 15 feet at Pittsburgh, 19 feet at tta, 23 at Cincinnati, 7½ at Louisville, and 16½ at Evansville.

indications are that the Missouri and its tributaries will continue to rise.

MONTHLY WEATHER-REVIEW, JUNE, 1873.

STORMS.

ing this month ten disturbances have crossed portions of the country east of the Mountains. The accompanying map shows, approximately, the paths of their s. The figures above them are the dates of the month; those below, 1, 2, and 3, te respectively the time of the morning, afternoon, and midnight observations; ts upon them show the location of the centers at each observation.

center of that of June 1 and 2 moved over Eastern Florida into Southern ia and disappeared, producing heavy rains and brisk winds.

3 and 4.—From Dakota over Iowa, Lake Michigan, lower lakes, New York, and England; accompanied by fresh and brisk winds over the Northwest, lakes, and ic States, and by rain, at places heavy, east of the Rocky Mountains, except on lf coast.

7, 8, 9, 10, and 11.—From Dakota over Minnesota, the lake region, and northern England; with rain, generally heavy, fresh and brisk winds, and occasionally thunder-storms, over the northern portion of the country.

12, 13, 14, and 15.—One southeastward over Minnesota to Lake Erie, and thence ast into Canada, causing thunder-storms, with rain-areas, generally light, and nd occasionally brisk winds from the Ohio Valley to the lakes; a second, appa- developing in the Southern States, thence eastward to the coast and northeast- ver probably Nova Scotia, with fresh and brisk winds and rain-areas on the coast.

14, 15, 16, and 17.—Over Dakota, Lake Superior, and thence probably over producing areas of light rain and fresh and brisk winds over the northern portion Middle States and the lake region.

18, 19, and 20.—Over Northern Minnesota, Lake Superior, and thence over Maine va Scotia, attended by occasional rain-areas and brisk and high winds over the est, lake region, and New England.

21, 22, 23, and 24.—From Dakota over Southern Minnesota to Iowa, then break- into and sending out to the eastward several minor disturbances, producing thunder-storms of short duration from Missouri and the Ohio Valley northward.

25, 26, 27, and 28.—Eastward over Northern Dakota, Minnesota, Lake Superior, rthern New England, sending a branch over Iowa, with severe thunder-storms nnessee to the Northwest, lakes, and New England.

28, 29, and 30.—Over Minnesota and the upper lakes into Canada, accompanied re thunder-storms north and west of the Ohio Valley, brisk winds over the est, lake region, and Atlantic States, and rain, often quite heavy, from the Lower ppi, Northwest and lakes to the Atlantic coast.

autionary-signal was displayed at Duluth on the 17th.

TEMPERATURE.

ean temperature for June, 1873, is higher than the mean for the month, except vicinity of Lake Superior, where it is lower by 0°.7 to 1°.8; in the South Atlantic t varies from 1°.6 below to 1°.0 above, and from New Jersey and Eastern Penn- to Maine, 1°.2 below to 1°.1 above. The excess is greatest in Northeastern ., 4°.5; Northern New York, 1°.1 to 4°.7; Kentucky, Ohio, Indiana, and Southern

Michigan, 1°.7 to 6°.5; Southern Alabama, 4°.9; Illinois, Southern Wisconsin, and Eas ern Iowa and Missouri, °.5 to 2°.1; Eastern Kansas. 4°.2; Southern and Western Minn sota, 4°.8 to 6°.7; Fort Sully, Dakota, 8°.0, (?) and Cheyenne, 4°.4.

The mean for June, 1873, is lower than that for June, 1872, at San Francisco, 1°.1; the Gulf States, 0°.4 to 1°.6; in the South Atlantic States, 0°.3 to 2°.0; in the vicinit of Lake Superior, 0°.4 to 1°.6. It varies in the Middle, Atlantic, and New Englan States from 1°.1 above to 3°.9 below. The former is the higher in Iowa and Souther and Western Minnesota, 4°.5 to 5°.5; in the Ohio Valley, 1°.0 to 4°.7; over the low lake region, 1°.1 to 2°.7.

Mean temperature.

Saint Louis	60.3	69.1	79.0	57.5	67.4	76.9	51.2	65.1	77.
New Orleans	70.8	76.0	82.5	70.4	75.8	80.5	66.9	73.7	80.

RAIN-FALL.

The returns for the month from the signal-service stations show that there has bee an excess of rain over the mean from Florida to Western Tennessee, and westward t Arkansas and Eastern Texas, varying from 6.50 inches to 0.86 inch, from Eastern Sout Carolina to Southern Virginia 1.29 inches to 0.60 inch, from Central Indiana to Sout eastern Missouri 1.42 inches to 0.68 inch, over Northeastern Ohio 1.23 inches, and fro Eastern Nebraska northeastward to Eastern Minnesota and Northern Wisconsin an over Northern Michigan 4.34 inches to 0.45 inch.

There has been a deficiency in New England varying from 1.79 to 4.00 inches, i the Middle States, except Southern Virginia, 0.44 to 3.26 inches, from northern portion of Georgia and South Carolina to the Ohio Valley 0.35 to 2.03 inches, from Northeaster Kansas to Southern Wisconsin and Northern Illinois 1.67 to 3.90 inches, over Northwes ern Ohio and Southeastern Michigan 0.29 to 1.23 inches, and over Western Minnesot 0.98 inch.

RIVERS.

The Red River rose steadily at Shreveport during the first week, after which remained nearly stationary until the 28th, when it began to fall slowly.

The Arkansas fell and rose alternately during the first twenty days, then fell steadil having been eight and a half feet lower on the 30th than on the 1st.

The Missouri at Fort Benton rose steadily until the 19th. Throughout the low portion of the river an almost continuous rise occurred, although a slight fall wa observed between Kansas City and Brunswick after the 26th.

The Mississippi fell slowly at Saint Paul and between Cairo and New Orleans, (excep ing some slight oscillations,) the difference between highest and lowest water for th month being at St. Paul nearly five feet, between Cairo and Vicksburgh nearly eigh feet, and at New Orleans eleven inches; between Le Claire and Warsaw a gradual ri occurred from the 4th until the middle of the month, after which a steady fall wa observed; at Saint Louis the water rose slightly between the 3d and 11th, falling slowl after that date.

The Cumberland at Nashville fell from the 1st to the 9th, then rose until the 19t fell again until the 27th, rose until the 29th, but on the 30th it began again to fal the difference between highest water (19th) and lowest water (9th) being six feet.

The Ohio, at Marietta and above, as well as its tributaries, has changed compar tively little; from Cincinnati to Evansville it has fallen almost continuously—th difference between highest and lowest water being nearly nine feet at Cincinnati an Evansville and three at Louisville; at Paducah the water fell from the 1st to the 11t rose until the 21st, falling again from that date until the 30th.

MONTHLY WEATHER-REVIEW, JULY, 1873.

STORMS.

During the month of July, 1873, thirteen areas of low barometer have been recorde on the daily weather-maps of the Signal Office; the tracks pursued by these will b found on the accompanying map No. 1; they have in general passed centrally over th

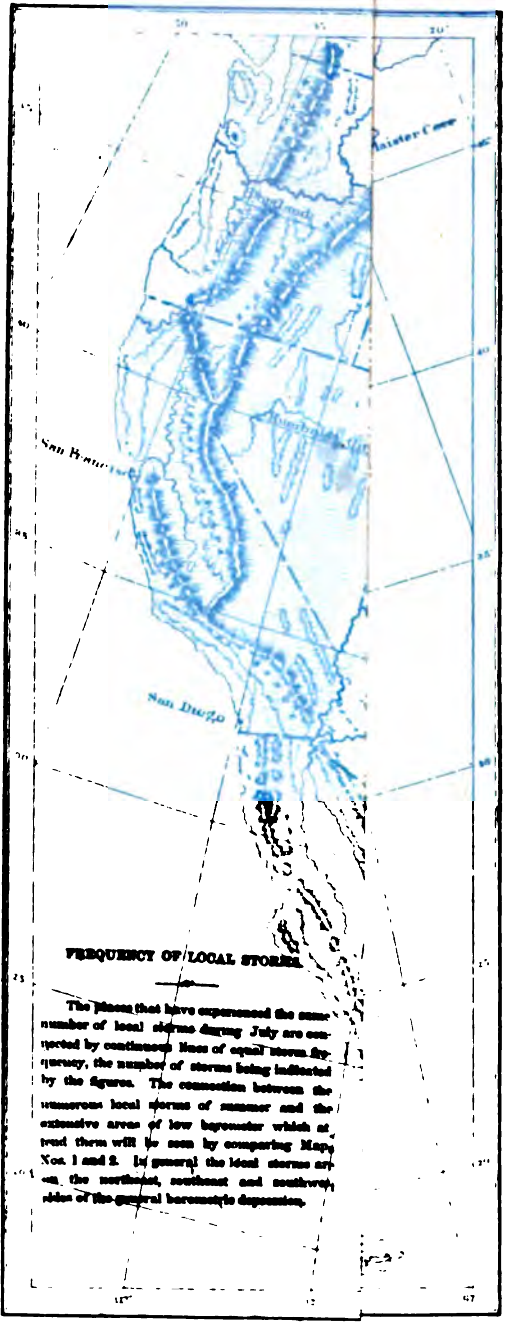
N. PETERS, PHOTO-LITHOGRAPHER WASHINGTON D.C.



FREQUENCY OF LOCAL STORMS.

The places that have experienced the same number of local storms during July are connected by continuous lines of equal storm frequency, the number of storms being indicated by the figures. The connection between the numerous local storms of summer and the extensive areas of low barometer which attend them will be seen by comparing Maps Nos. 1 and 2. In general the local storms are on the northeast, southeast and southwest sides of the general barometric depression.

A. PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D.C.

me northern limit of the United States. This feature has indeed been this year r more noticeable than in former years, as is seen from the following statement:

1871. The mean latitude of the tracks of 15 centers of low barometer was 45°.
1872. The mean latitude of the tracks of 14 centers of low barometer was 44°.
1873. The mean latitude of the tracks of 13 centers of low barometer was 47°.

in former years during this month, so in the present year, with scarcely an excep- the areas of low pressure first became apparent in or beyond Dakota and Mani- On most occasions the appearance of a low barometer in the Northwest has preceded by slight barometric depressions on the coasts of Oregon and California, has been impossible to decide whether the disturbances have passed from the ic Ocean eastward or have originated in the Rocky Mountains of British America. e numerous local storms that are experienced during the summer months have a in relation to the large areas of high and low barometer, to the topography of the ry, the position of the ocean and other bodies of water, &c., &c., all of which may tter understood from map No. 2, on which are drawn with some approach to cor- ess the lines of equal storm frequency for the month of July. The local storms h are almost invariably attended with lightning, &c.) have been most numerous orida, on the west and southwest side of the area of high barometer that prevails g July on the Atlantic, between the latitudes of 12° and 30° north. The region xt greatest frequency is in Ohio and Western Pennsylvania, where the south and west winds attending the areas of low pressure rise up over the high country of States. The storm frequency diminishes as we proceed from the Gulf coast ward over the low, flat country and northwestward toward the high arid plains; e other hand it increases as we proceed from the middle and east Atlantic coasts vard up a rapid slope to the summit of the Appalachian range. The local storms ast frequent on the dry plains west of the valley of the Mississippi River, and are indications of a region of diminished frequency in the northern part of the nce of Ontario, though this may possibly be due to the scarcity of our stations in egion.

WINDS.

winds of special severity have been reported during this month, except the tor- of July 3, at Indianapolis. The winds have reached the limit of *high* (a velocity rty miles an hour) only twice in the Middle Atlantic States and thrice in Dakota orthern Minnesota. The prevailing winds (by which is merely meant the wind as been recorded the greatest number of times) are shown by arrows on map No. n which we also perceive something of the connection between the winds and obars. In general it may be stated, that south and southeast winds have pre- l in the Gulf States, Iowa, and Minnesota, but elsewhere over the country east of ocky Mountains the prevailing winds have been from the south, southwest, and

RAIN-FALL.

total amount of rain during the month appears to have been in excess in Indi- llinois, and Michigan, and on the southern border of Lakes Superior, Erie and io, as also in New England. The reports from the summit of Mount Washington a rain-fall of 13.5 inches, as contrasted with only 3.5 inches in July, 1872. On the hand the rain-fall of June was 3.5 inches, while in June, 1872, 18.5 inches were ed; by combining the two we obtain for June and July together, in 1872, 22 , and in 1873, 17 inches. A deficiency of rain is apparent in the province of On- on the middle Atlantic coast, over the Lower Mississippi valley and in the North- The details of the rain-fall are given for each geographical subdivision in the panying table.

Table showing the rain-fall and temperature for July, 1873.

District.	Average rain-fall.	Average temperature.
	Inches.	*Degrees.*
ngland	3.5 or an excess	70 or an excess.
e Atlantic States	3.5 or a deficiency	77 or an excess.
lake region	5.0 or an excess	71 or normal.
lake region	4.5 or an excess	66 or normal.
Atlantic States	5.5 or normal	81 or a deficiency.
n Gulf States	5.0 or normal	82 or an excess.
rn Gulf States	5.0 or normal	82 or a deficiency.
Valley	4.5 or a deficiency	77 or an excess.
Mississippi Valley	2.0 or a deficiency	80 or normal.
Mississippi Valley	4.0 or a deficiency	75 or a deficiency.
Missouri Valley	2.0 or a deficiency	75 or an excess.
orthwest	3.0 or a deficiency	75 or normal.

TEMPERATURE.

The temperature has very generally averaged one or two degrees lower than for th corresponding month of 1872, which latter was indeed in many places one of the warm est on record. Compared with the average of many years, the past month seemed t have been from one to four degrees warmer than the normal temperature over th Middle Atlantic and the Eastern Gulf States. In general, however, over the rest o the country east of the Rocky Mountains the temperature has been slightly below th average, the deficiency amounting to one or two degrees in the valley of the Missis sippi River.

The accompanying table shows for each geographical subdivision the general mea temperature, as observed and as compared with normal values resulting from man years of observation.

The details of the distribution of temperature may be seen from the isothermal line given on map No. 3, and which hold good for the general surface of the earth.

The monthly range of temperature, or the difference between the highest and lowes temperatures that have occurred during the month, is given by the lines of equa monthly range on map No. 4. It will be seen that the range is greatest in high an dry localities, and least in low and damp regions. The range also increases decidedl with the latitude, even on the Atlantic coast, a phenomenon doubtless due to the greate changes in cloudiness and humidity.

RIVER AND OCEAN TEMPERATURES.

Reports have been received for the last ten days of the month from some of th stations that have, at the suggestion of the United States Commissioner of Fish an Fisheries, been furnished with apparatus for observing the temperatures of the wate in the rivers, bays, &c.; the results promise to be of general meteorological interest The general results of these observations (the first of their kind) are given in the tabl printed on the border of map No. 3, where the comparison may easily be made betwee the temperature of the water and that of the air, &c., &c.; the water-temperature refer to the lowest stratum of water near the bottom of the river or bay, and the obser vations are made daily at 3 p. m.

In general it is found that the range of temperature increases very regularly as w proceed from Cape Hatteras northeastward. The figures for each day show that th temperature steadily increased at Boston and New London from the 18th to the 27th and then began as steadily to diminish. This change may be due either to a tidal in fluence or to a change in the warm currents of the adjacent ocean.

RIVER-OBSERVATIONS.

A general view of the results of observations of the water in the rivers is given i the table accompanying map No. 3. In addition to this table, the following remark only are necessary. The Red River fell steadily during the entire month. The Mis souri fell almost continuously, except at Leavenworth, where it rose during the first week of July. The Upper Mississippi has declined somewhat; the middle portion o the river was at first stationary or slightly rising, and then began to fall steadily; th lower portion of the river, after falling and rising, has again begun to fall. The Cum berland has experienced three sudden rises and subsequent falls, attending thre periods of rain. Similar oscillations have occurred in the Ohio, a specially large wav having moved from Pittsburgh to Louisville between the 6th and the 10th of th month.

CAUTIONARY SIGNALS.

No cautionary signals have been displayed during the month.

MONTHLY WEATHER-REVIEW, AUGUST, 1873.

The general meteorological conditions as determined from the observations taken a the stations of the Signal-Service, United States Army, during the month of August 1873, are indicated upon the accompanying maps.

In comparing these conditions with those of the corresponding period in previou years, the most noticeable features are—

1st. The excess of barometric pressure over New England and the Middle Atlanti States.

2d. The diminution of temperature below the mean for the month of August in pre vious years, in the districts above named, and thence westward to include the lowe lake region and the adjoining States.

3d. The unusual quantity of rains in the Middle Atlantic district, especially nea the coast.

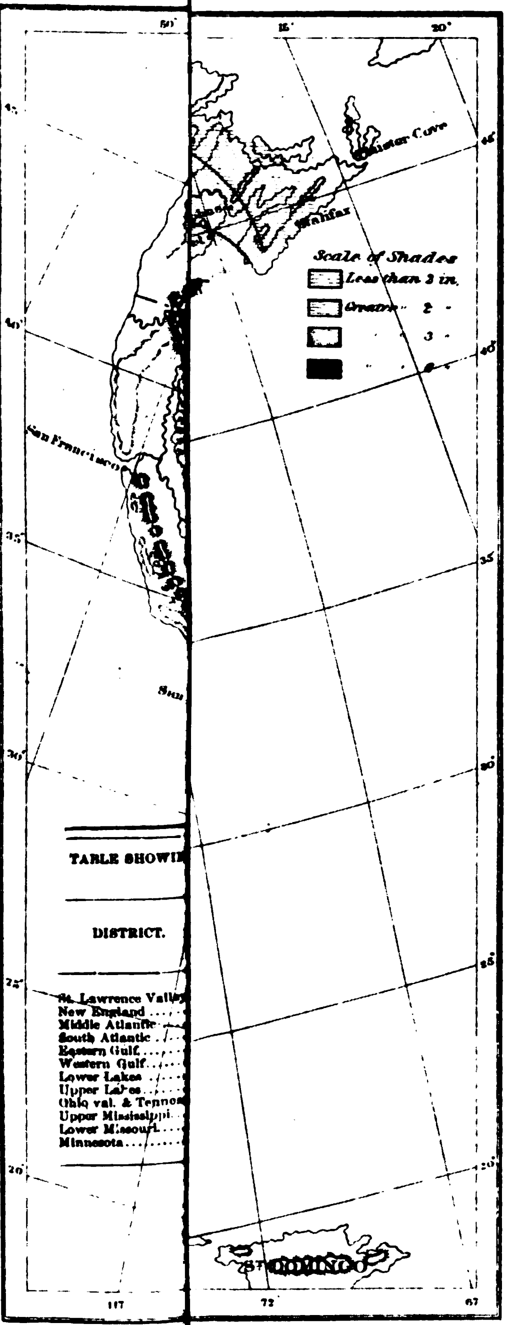
*No depth given.



N. PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D. C.

paths of the centers of the several areas of high barometer are traced on map

se areas, with but one exception, were first observed in British America, after they moved with such uniformity, and became so unusually well defined as to it possible to locate their centers at each of the tri-daily reports of this office he time of their first appearance until they finally passed beyond the limits of ations.

general direction of these paths while the areas remained central on the conti- s approximately from the northwest to the southeast, but for want of more ex- observations their final direction after passing off the coast remains as yet un- ined.

ng the month of August, 1873, twelve areas of low barometer have been traced tri-daily weather-maps, and the tracks pursued by the centers of these areas, xplanatory notes, are represented on map No. 2. Track No. 2 may be found on p accompanying the weather-review of July.

e areas of low barometer were, with one exception, first observed either in the ies of the United States east of the Rocky Mountains or in Manitoba; and by g to map No. 3, it will be found that this region is one of mean low barometer month. Seven of these areas passed eastward to the Atlantic coast within the f our stations, with a mean latitude of 43°.

emaining areas passed to the northeastward into British America without any atmospheric disturbance in the United States.

STORMS.

reas of low barometer traced on map No. 2 were accompanied with slight dis- e while in the western portion of the United States, but no marked change in ther occurred until the 11th of the month, when the area of low barometer No. 6 was first observed in Kansas.

torm moved slowly to the eastward, with cloudy weather, rain, and light to nds, the winds increasing in force as the center approached the Atlantic coast, lly producing the northeasterly gale which occurred on the middle Atlantic England coast on the 14th and 15th. For this storm cautionary signals were d at Cape May, New York, New London, Wood's Hole, Boston, Portland, and

cond storm, and by far the most severe one that has occurred since the estab- of the signal-service, is traced as No. 10 on map No. 2. Although this storm did within the limits of our stations, there were indications of some atmospheric ce off the middle Atlantic coast on the 23d which warranted the prediction he Probabilities written from the afternoon report of that date, viz, "For the land and middle Atlantic coast, threatening weather," and from the midnight the same date, "For the New England and middle Atlantic coast, stormy with cautionary signals at Cape May, New York, and New London.

rm, in consequence of its severity, is one of unusual interest, and the course r it may vary from the actual, which cannot be determined until additional been obtained, when a complete and accurate description will be published fice.

rd decided storm of the month was first observed as an area of low barometer tern portion of Kansas on the 29th at 11 p. m. This area moved to the east- the lake region without any marked disturbance until the night of the 31st, k and high winds, with areas of rain, were reported. On the morning of the tember it had become unusually well defined in the lower lake region, after assed over Northern New England and off the Atlantic coast with increasing ly producing a violent storm since reported from vessels which were in the ntic on the 2d and 3d of September.

WINDS.

om the storms above referred to, no winds of special severity have been xcept from Dubuque, Iowa. At this station a violent tornado occurred on ich, although entirely local in its nature, developed an unusual force and t destruction of property. Owing to the carrying away and destruction of neter at this station no recorded velocity of this wind has been obtained.

ual velocity of one hundred miles per hour was reported from Mount Wash- I., during the storm of the 16th. The force developed by this wind has not d at any other station since the establishment of the signal-service.

ction of the prevailing winds of the several stations is indicated by the the map No. 3, and in comparing these directions with the isobarometric same map, it will be observed that they incline toward the area of mean ter.

W

RAIN-FALL.

The total quantity of rain during the month, as deduced from the reports of the several geographical sections, is given in the accompanying table on map No. 4. In the Middle Atlantic States and in Minnesota there has been a decided excess over the mean rain-fall as calculated from observations of previous years; while there has been about the usual amount in the South Atlantic and Eastern Gulf States; in the remaining districts there has been a deficiency. In the table referred to the quantity of rain given has been deduced by taking the general average of the reported rain-fall from the several stations in each district. The general distribution of the rain-fall, as deduced from the reports received at this office and presented in the table above referred to, is graphically represented on map No. 4.

TEMPERATURE.

In New England, the Middle States, and thence westward over the lower lake region and adjoining States, the mean temperature has been from two to five degrees below the normal, and about three degrees above the normal in the upper lake region, the Upper Missisippi and Lower Missouri Valleys, but in the districts last named the temperature has been lower than reported for August, 1872. The results of the observations for the month are given in the accompanying table, in which is noted the comparison of the temperature of the several districts, with the mean temperature deduced from observations of previous years. The isothermal lines for the month, given on map No. 3, indicate the general distribution of temperature throughout the United States.

RIVER AND OCEAN TEMPERATURES.

The number of stations supplied with the necessary apparatus for determining the temperature of water has been greatly increased, and the observations which were commenced during July have been continued and promise to be of general meteorological interest.

The table given on map No. 3, presents a general synopsis of these observations. The temperature noted is that of the lowest stratum of water at the place of observation.

RIVER-OBSERVATIONS.

In general these observations show that the rivers draining the eastern slope of the Rocky Mountains were steadily falling during the entire month; and that those draining the western slope of the Appalachian range, experienced fluctuations attending the rains of these districts. The table on map No. 3, presents these observations in a consolidated form.

MONTHLY WEATHER-REVIEW, SEPTEMBER, 1873.

STORMS.

During this month eleven low barometers have crossed the country east of the Rocky Mountains. Map No. 1 shows, approximately, the paths of their centers which have passed over the lake region in a northeastward or eastward course, excepting the two on the South Atlantic coast. Several of them were remarkably severe over the upper lakes, and destructive to shipping.

That of August 30, 31, and September 1, was accompanied by occasional rain and brisk winds over the Northwest, Ohio Valley, lake region, Middle States, and New England, the winds increasing to high from Michigan eastward over the lower lakes and Saint Lawrence Valley.

September 2, 3, 4, and 5, by brisk and occasionally high winds and rain from the Northwest eastward over the lake region, Ohio Valley, Middle States, and New England. A hurricane was reported as having lasted about one hour on Lake Michigan, and tornadoes in Massachusetts on the 4th; very severe thunder-storms, with high winds in Eastern Tennessee on the 3d, and Southeastern North Carolina on the 5th.

September 11, 12, and 13, by rain at nearly all of the stations east of the Rocky Mountains; brisk and high winds over the Northwest and upper lakes; severe "norther" in Texas on the 13th; heavy snow on Mount Washington on the night of the 14th.

September 14, 15, and 16, by high south and west winds over the Northwest and upper lakes; occasional rain over Minnesota, the lake region, and New England.

September 17, 18, and 19, by high winds over the Northwest, lakes, and Saint Lawrence Valley; by rain from the Northwest eastward over the lakes, Ohio and Saint Lawrence Valleys, Middle States, and New England.

N. PETERS, PHOTO-LITHOGRAPHER, WASHINGTON, D. C.

September 18, 19, and 20, by brisk and high winds and heavy rain from Florida to outheastern Virginia, having been very severe on the coast.

September 22 and 23, by brisk winds and heavy rains on the South Atlantic coast.

September 23 and 24, by high winds over the Northwest and lakes; rains from the Missouri and Ohio Valleys to the lakes and Middle and East Atlantic coast. This was he severest storm of the month, especially on the upper lakes, whence very heavy ales were reported.

September 25 and 26, by high winds over the Northwest and upper lakes, with occasional rain; light snow in Montana on the 26th; heavy gales on the upper lakes.

September 27, 28, and 29, by high winds on Lake Ontario and the lower Saint Law-ence Valley; rain in all sections east of the Rocky Mountains, except the east Gulf States; followed by a severe "norther" in Texas during the night of the 29th and the morning of the 30th, and by light snow from Northern Minnesota and Dakota northward.

On the 7th, 8th, and 9th, an area of high barometer extended itself eastward over he Northwest, lake region, Ohio Valley, Middle States, and New England, with fall-ng temperature, and with light frost over the Northwest and upper lake region.

13, 14, and 15.—A second, over the same region with quite heavy frost, which was ery severe on the morning of the 13th over Dakota, Minn., and the northern portion f the upper lake region.

16 and 17.—A third over the Northwest, lakes, Middle States, and New England, with frost over the northern portions of these sections.

September 19, 20, and 21.—A fourth, from the Northwest over the lakes, Ohio Valley, Middle States, and New England, with frost, except probably on the immediate coast.

September 29 and 30.—A fifth, from the Northwest south and east over the entire ountry, with low temperature, producing frost over the northern sections.

TEMPERATURE.

On map No. 2 will be found a table of the average mean temperature for the dif-erent districts for this month. For New England, the South Atlantic States, the Ohio Valley, and Tennessee, it is the same as that for many years. For the Middle Atlantic nd Gulf States, and the lower lake region, the former is the greater, from 0°.4 to 0°.6. For the upper lake region, Minnesota, and Upper Mississippi and Lower Missouri Valleys, t is less, from 1°.2 to 2°.5. Compared with the average for the same month of last ear, the former is the lower for the stations in all of the districts, except the South tlantic States, Tennessee, and the Ohio Valley, where it varies slightly above and below the latter.

RAIN-FALL.

Map No. 3 gives, approximately, the rain-fall for the various districts east of the Rocky Mountains. A table upon the same shows where there has been the average all, excess, or deficiency.

RIVERS.

The observations show that the Missouri, Red, Mississippi, and Ohio Rivers fell quite teadily during the month, excepting slight oscillations in the head-waters of the wo latter, produced by rains. The Cumberland fluctuated more or less, having been ower October 1 than September 1. Upon map No. 3 will be found a table which xplains itself.

Sixty-one cautionary signals were ordered to be displayed at our own stations during the month for seven storms, and the majority of them on the lakes. Thirty Canadian stations were warned of the approach of storms.

PAPER 27.

Special Orders } WAR DEPARTMENT, OFFICE OF THE CHIEF SIGNAL-OFFICER,
No. 78. } *Washington, D. C., June 14, 1871.*

Sergeant Frederick Meyer, observer, Signal-Service, U. S. A., will proceed without lelay to New York City, and report to Captain C. F. Hall, commander of the North Polar Expedition, for duty in connection with that expedition. He will, in addition o the performance of duty under the orders of Captain Hall, carry out the written nstructions received from this office.

The Quartermaster's Department will furnish the necessary transportation.

By order of the Chief Signal-Officer of the Army,

GARRICK MALLERY,
Capt. and Bvt. Lieut. Col., U. S. A., Acting Signal-Officer and Assistant.

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGN
DIVISION OF TELEGRAMS AND REPORTS FOR THE BENEFIT OF C
AGRICULTURE,
Washington, D. C

SERGEANT: The Chief Signal-Officer directs that you will take c during your entire expedition at 7.35 a. m., 4.35 p. m., and 11.35 p mean time, of the barometer, thermometer, wind, and weather, a meteorological observations as are compatible with the duties assign Hall.

Among these additional observations, you will particularly bear i ing:

1. Frequent observations of the barometer, wind, and weather a ate to the above.
2. Regular observations of the minimum and maximum thermom
3. Velocity of wind at sea, especially in gales, and made with nu ters in different positions.
4. Forms and motions of clouds, and meteor-tracks.
5. Ozone.
6. Electrical and auroral phenomena.
7. Solar and terrestrial radiation thermometers.
8. Forms, &c., of snow-crystals.
9. Heights of twilight arcs—noting the time very exactly.
10. Dew-point at very low temperatures.
11. Spectrum-lines or bands in the aurora and the atmosphere.
12. Polarization of atmospheric light and position of neutral poin
13. Rain and snow fall at different altitudes.
14. Temperatures of sea and rivers and springs, and the earth a of 3, 6, 12, 24, and 36 inches.
15. Habits of plants and animals as affected by climate.

You will take special care to make accurate comparisons of you with other instruments that you may find at points on your journe used for meteorological observations.

You will keep all the records for any period as far as possible in book; dividing it into two portions, one for the systematic obser hours, the other for occasional observations.

You will keep a duplicate record of the systematic and more imp observations on Form 4, and forward the same to this office as ofter offer.

Very respectfully,

H. W.
Second Lieut. and Brt. Capt., U. S. A., Acting Signal-Offi

Sergeant F. MEYER,
Observer, Signal-Service, U. S. A.

SERGEANT FREDERICK MEYER'S REPORT ON POLAR EXPEDITION, 1871-'73.

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGN
Washington, D.

GENERAL: I have the honor to inclose a report of my proceedin nection with the North Polar Expedition, which, by Special Or ordered to accompany. All items and data of this report are from based upon notes taken at the time of their occurrence, with the e observations for geographical position, and general outline of adven on the ice.

The report naturally arranges itself under the two general headin

I. History of the expedition.
II. Scientific operations of the expedition.

Heading II, according to the instructions of the National Academy sists of—

1. Astronomical observations.
2. Magnetic observations.
3. Observations on the force of gravity
4. Observations on ocean physics.

5. Meteorological observations.
6. Natural history.
7. Geology.
8. Observations on glaciers.

No. 1 subdivides—

A. Astronomical observations at winter quarters.
B. Astronomical observations on sea and at ports of Greenland.
C. Astronomical and geodetical observations, forming a series of systematic surveys.

No. 2 subdivides—

A. Differential observations.
B. Observations on absolute declination.
C. Observations on intensity, (relative and absolute.)
D. Magnetic inclination.

No. 4 subdivides—

A. Depths.
B. Examination of sea-bottom.
C. Sea-temperature.
D. Density of sea-water.
E. Currents.
F. Tidal observations.

No. 5 subdivides—

A. Pressure of atmosphere.
B. Temperature.
C. Winds.
D. Clouds.
E. Precipitations.
F. Ozone.
G. Solar and terrestrial radiation.
H. Crystallization of snow.
I. Moisture.
K. Electrical phenomena.
L. Auroral phenomena.
M. Heights of twilight arcs.
N. Optical phenomena.
O. Shooting-stars and meteors.
P. Miscellaneous.

F. MEYER,
Observer Signal-Service, U. S. A.

Brig. Gen. A. J. MYER,
Chief Signal-Officer of the Army.

GENERAL DESCRIPTION OF THE VOYAGE OF THE STEAMER POLARIS FROM NEW YORK TO GODHAVN, DISCO.

I.—HISTORY OF THE EXPEDITION.

In compliance with the instructions received from the Chief Signal-Officer of the Army, I proceeded to New York in order to report myself to Captain Hall, commander of the North Polar Expedition, then about in readiness to leave port on its voyage to the arctic regions. Arrived at New York, I set at once to work to procure several nstruments to complete my outfit as meteorologist of the expedition, and arranged my plans in regard to meteorological work.

All this occupied the entire time the Polaris was anchored at the Brooklyn navy-yard, where numbers of visitors appeared every day to look over the ship and give us their wishes to the adventurous enterprise which we were then about to undertake. The noble people of New York and Brooklyn did not only wish us a successful voyage, but they also contributed largely to our library, in presenting, for the use of the crew, enough of reading-matter to wear away agreeably the long and dark winter months soon to come.

om north latitude 40° and west longitude 70° to north latitude 42° 20′ and longitude 60°, the equatorial and polar currents follow their course respectively, northeast and west-southwest, in close proximity, and produce heavy fog by rapid ge of temperature of air-currents as they pass over the surface of sea-currents of different temperature. On the other hand, whenever the wind blows in such tion as to cross sea-currents, driving the waters of one into the other, the ent specific gravity of those currents will necessarily cause an additional motion e waters, which is shown by the above-mentioned swell.

one hour, Greenwich time, we commenced to take three-hourly meteorological vations, which, in connection with the latitude and longitude derived from nomical observations and the log, make up the complete meteorological record of oyage. During the following day, the fog and swell of sea continued to increase, ng a clear sky whenever the fog was depressed by a strong upper current.

o on July 5 and 6, we were perfectly encircled by a fog, the sea continuing to be

ly on July 7 having come up to north latitude 42° 20′ and west longitude 60°, the sappeared, and the sea ran smooth.

July 5 we commenced to take frequent observations of the sea-temperature on rface and at greater depths, as also of the specific gravity of the water. In the ng the sea-temperature fell very rapidly, we being far from the direct influence equatorial current.

ing July 8 fog made its appearance again, the wind blowing from a westerly direc- hich carried the warmer air over the cold currents, upon which we were then ssing, and which kept a nearly stationary temperature.

July 9 the temperature of the sea fell still more, governing the temperature of , while heavy fog, caused by northerly and westerly wind, would not permit us the ship during night on such dangerous grounds as the Newfoundland banks. ard morning of July 10 the fog condensed into light rain, until in the afternoon he sea-temperature suffered a very rapid depression, which caused heavy fog, over into rain.

lly, at 12 m., July 12, we arrived at St. John's Harbor, where we found the sea- ature quite low, while the air-temperature, influenced by the soil, was con- ly higher. Hardly any fog makes its appearance in St. John's Harbor, the air ery dry, and not capable of producing condensed vapor in the lower strata of here.

ohn's Harbor forms a small basin encircled by granite rocks, having the appear- being encaved and rounded by former glaciers. We anchored at St. John's until the 19th of July, Captain Hall being engaged in making additional pur- of coal and provisions. At 4 p. m. July 19 we left St. John's Harbor, being ac- ied by the American consul of St. John's, who, when he left the ship with the as cheered three times, to which he responded in the same manner.

t five miles from the coast, bearing southwest by south, we saw a mirage of a la, showing an inverted image immediately above the one seen directly and in stinct outlines. We also saw a faint aurora at 9 p. m. of 45° altitude bearing th, and consisting of faint red and yellowish rays going over into white light.

ly 21 we found the sea-temperature increasing and nearly equal to that of the ward morning of July 24, north latitude 55° 42′ and west longitude 51° 30′, temperature stood above that of the air until morning of July 25, when the erature rose above that of the sea.

ly 25 toward midnight we saw a brilliant aurora, which, making its first ap- e as an illuminated cumulo-stratus cloud, soon transformed into a broad ribbon are-edged, screw-like appearance, and based by the same cloud, which showed ish light. The ribbon or screw showed distinctly all colors of the spectrum, ading parallel with the horizon, and at the crown, first formed a faint arc of light over its crown and then transformed itself into a faint arc of spectrum hich finally combined with the upper arc, showing a most brilliant arc of light with diverging rays of purple and violet color.

y 27 we arrived at Fiskenaes, where Captain Hall intended to engage for the f the expedition the Esquimaux, Hans Christian, who had been a member of litions under Dr. Kane and Dr. Hayes.

re informed that Hans Christian was then at Upernavik, and in the Danish ser- skenaes is a small village of seventy inhabitants, which are mostly half-breed ux, and live on the earnings of seal-hunting and fishing, by exchanging them sions and necessaries of life which the Danish government provides for them. ange is conducted by Gov. M. Shonheyder, under whose jurisdiction comes ittle missionary settlements of Lichtenfels, located on the same island to the t, and inhabited by ninety members of the brotherhood. Both villages be- e district of South Greenland, and their provisions are sent yearly in open n Godhaab, the principal place of South Greenland, which boats return to with the fat, blubber, and cod-livers bought by the governor of Fiskenaes.

Fiskenaes is entirely built on rocks, which consist of granite, with quartz-veins ar porphyry. Vegetation is scarce; only the governor possesses a few artificial beds vegetables, but an abundance of alp-flora are vegetating in the neighborhood. Ve few reindeer are to be found near Fiskenaes, and the ice-bear approaches only abo once in twenty years; but an abundance of seal and codfish is yearly collected.

The Esquimaux inhabitants are of good appearance, well fed and healthy-lookin which the governor assures me is the result of a law issued by the Danish governme prohibiting the sale of fresh fish and compelling the natives to keep a large supply fish on hand in storage for the long cold winter.

The male Esquimaux, in average, measures five feet, is of rather lazy habits b great endurance, and from eight to fifteen live in one small house built of lumber, ar covered with peat, or entirely built of turf. The female Esquimaux is smaller bui with very small hands and feet, and their hair tied at the crown of their heads by ribbon, which, according to its color, signifies their state in relation to matrimoni life. A red ribbon signifies the female to be a virgin; blue, a married woman; bla and white, a widow; white with a small ribbon wound around it, a widow who wish to marry; green, a girl who has borne a child.

Each congregation has a teacher or catfiecet, who preaches the divine word, but not allowed to join members of the congregation in matrimony.

The minister of the gospel and physician visit the place once a year.

Several remarkable habits of the Esquimaux were related to me, of which I no the following most remarkable:

After taking the holy sacrament each native shakes hands with all present Eur peans, which signifies their gratitude in regard to the acquirement of the Christian r ligion. Mortality among the natives is not great, but greatest in spring. It has bee related to me that during last winter forty inhabitants of an island near Julianha perished by starvation, being blocked in by ice in such a manner as not to permit a provisions to be sent there.

The mean temperature of Fiskenaes during summer months is said to be about +1 Reaumur, while the winter is not very severe, and sometimes rather mild, as in t case of the preceding one, when the greatest cold observed was —14° Reaumur. T prevailing winds are northerly in winter and southeasterly in summer.

During winter months a southeast wind bears almost always the character of gale approaching in elastic waves, which strike the lower strata of the atmosphere intervals, and are very dry and rather mild. The snow-line in South Greenland, I w informed, varies from 2,000 to 3,000 feet elevation, and therefore no permanent snow known at Fiskenaes, none of the surrounding mountains being higher than 2,000 fe

At 3 a. m., July 29, we left Fiskenaes, encountering a southwest gale, indicated by light westerly wind and a rapid rise of the barometer on the evening of the precedi day and morning of July 29. At 8 a. m. the wind veered to northwest, the baromet falling rapidly, which continued after the wind had veered to southwest.

The change of wind to southwest was accompanied by light rain, which ceasing intervals grew into heavy rain, with an increasing force of wind.

At 7 p. m. the maximum velocity of wind was thirty-six miles per hour, and t minimum height of the barometer was 29.649, occurring at 8 p. m., when the force wind gradually decreased, and the barometer slowly rose until 11 p. m.

At 11 p. m. the wind shifted slowly to west on the way to northwest, and rapid lessened its force—the barometer rising rapidly, and clouds clearing away.

During the entire time the thermometer, within a very small range, marked di tinctly the succeeding phases of the storm, rising until the barometer reached its ma imum, on the morning of July 29, and then falling up to the time when the southwe wind set in, when, rising again for a short period, it continued to fall until the wi gradually veered to west. At 11 a. m., July 31, we arrived at Holsteinborg, where found two Swedish government vessels, (steamer and schooner,) which were then their return to Sweden, having been sent to Disco, in order to take up a piece of m teoric iron, which is thought to weigh about 300 tons, and in addition to which th found two more pieces of the same structure. These two vessels, under command Captain Van Otter, having on board a botanist and a geologist, steamed and sailed as far as Upernavik, sounding and ascertaining frequently the surface and botto temperature of the sea. They also stated that the sea upon which they had be cruising was unusually free of ice, and very favorable for our voyage.

At 4 p. m., August 2, the Swedish vessels left port, proceeding on their voyage Sweden. Holsteinborg is a small but beautifully situated village, surrounded by hi and steep mountains of granite, and under the jurisdiction of Governor Elsborg. Ba ren of vegetation, with the exception of a few artificial beds of vegetables in poss sion of the governor, the alp-flora is of less variety. Reindeer are scarce, and wh we reached Holsteinborg no reindeer-skins were to be got—ice-bear being also rarity.

The natives are of the same type as at Fiskenaes, following the occupation of hunti fishing, and occasionally whaling, which they keep up with success on their own t during winter, sailing to the west side of Davis's strait during summer.

n July 31, Captain Hall, Dr. Bessels, and I went ashore, in order to take sights for itude of Holsteinborg, and ascertained, according to my computation, Holsteinborg e situated at 53° 53′ 45″ west longitude.

3 p. m., August 3, we left Holsteinborg, and proceeded to Godhavn, or Lively, o.

oout thirteen miles from Holsteinborg we passed by the peak known as Woman's d, which on its southerly extremity resembles very much a woman's hood, and of h I made a sketch. We arrived at Godhavn at 3 p. m. August 4, where, in consul- n with the governor of Lively, Mr. Lassen, we learned that good coal might be t Scansen and Rittenbank, but that the first-mentioned place was dangerous to or at, being exposed to southwest gales. Captain Hall, therefore, concluded to for the supply-vessel until the 15th of August, and then proceed to either one ese coal-mines.

also dispatched a boat, under the command of Mr. Chester, to Jacobshavn, where nspector of North Greenland stopped at the time, in order to induce him to come vely, so that Captain Hall might be able to procure the necessary stores, in case upply-vessel should not arrive in time. Mr. Chester left Godhavn at 1 p. m., st 6, and returned at 2.30 a. m., August 11, bringing with him specimens of the of Scansen, which showed the structure of wood, and formed thin layers.

August 5 we saw a parhelion, which showed a distinct eccentric ring of spectrum s, the red light facing the sun; yellow, green, and faint blue following in succes- The altitude of the sun was at the time 14° 54′, and of the ring (vertex) 75° 26′. ng north of the sun at a distance of 22° 42′ a parhelion made its appearance show- intly the spectrum colors, the red light facing the sun, yellow following, and g in distinct white rays of at least 20° length.

August 10, at 2 p. m., the steamer Congress, under command of Captain Daven- with supplies of provisions and coal, arrived at the port, having on board Dr. an and Mr. Bryan, ministers of the gospel, and Mr. Bryan, jr., the astronomer of pedition.

ll briefly state that after the arrival at Godhavn of the Congress, with provisions al, several days sufficed for the transfer of these provisions and coal, partly to laris and partly to the store-house of the Danish government. While at this y Captain Hall was considering about my return to the United States; he had d me solely to attend to the navigation of the vessel and keeping of his journal, ohibited all meteorological observations, and observations of any description; der I thought to be in discordance with my instructions and the general purpose presence with the expedition, and I therefore applied for permission to return to ates. At first Captain Hall appeared willing to grant my request, but shortly the Polaris left Godhavn he changed his intentions, and permitted me to com- h my instructions from the office of the Chief Signal-Officer of the Army, besides cution of his own orders. I gladly accepted Captain Hall's decision, and ex- l my general willingness to promptly execute his orders.

ing Godhavn, where Captain Hall had procured a written permit of the in- of North Greenland for Hans, the Esquimaux, to leave the Danish service, and hat of the Polar Expedition, the Polaris headed to the west of north, and after ys' run arrived at Upernavik, a comparatively large settlement of natives, under nish government. At the latitude of Upernavik, and even farther south, the f Greenland is studded with small islands and rocks, which like a line of skirm- rotect the coast from the wearing influence of the heavy arctic ice, continually g by on its long trip from the high northern latitudes, where it arises and grows, to antic Ocean, where it wastes and finally disappears. On one of these islands vik is situated, with a snug little harbor, protected on three sides by hills of ble size. As soon as the anchor dropped, Dr. Rudolph, the governor, and erg, who was to take the governor's place in the course of a few days, visited ris, and at once were presented by Captain Hall with letters from Inspector who enjoined the Danish officers to do their utmost in procuring dogs and r the expedition, as well as to be of general assistance to Captain Hall in the transactions of the expedition. Already, the morning following our arrival navik, a great number of seal and dog-skins and a few dogs were received on nd a boat expedition under command of H. C. Chester, mate, sent to Proven, to rnor of which Dr. Rudolph previously had dispatched, by kiak-mail, orders 's departure from Proven, and for the deliverance of the same to Mr. Chester, ordered by Captain Hall to engage Hans's services for the expedition. Mr. with Hans and family returned to the vessel a day or two after. Soon after ris was gotten ready for departure, and the governor, Mr. Elberg, who had d Dr. Rudolph, accompanied the expedition to Tessuisak, where he intended Captain Hall in procuring a great number of dogs, and to conduct the final transactions of the Danish government with the North Pole Expedition.

Tessuisak is situated on an island which lies in the entrance of a deep bay, the hea of which consists of a large glacier, and consequently the bay always abounds in ic bergs. At the season of our stay at Tessuisak these icebergs were rather far advance in decay, and hardly at any time the air would not be vibrating by the tumbling an rolling of one or the other iceberg, causing a noise most similar to the sounds of battl in the roaring of field-pieces.

As expected, Captain Hall procured a number of dogs and ready-made skin cloth ing at Tessuisak, settled his accounts with the Danish government, and, as soon as t weather permitted, left the harbor of Tessuisak with Mr. Jensen, the acting governor Tessuisak, as pilot. Captain Hall had exerted all his powers of persuasion to induc Mr. Jensen to join the expedition, but in vain. Mr. Jensen would only agree under th unreasonable condition that he should have the command of the vessel on her a rival in Smith's Sound. The first evening and night after leaving Tessuisak we mad but little progress in Melville Bay, as thick fog compelled us to advance carefully but on the morning of the second day Cape York was sighted and the appearance of Ca Dudley Digges expected. When arrived at the latitude of Cape Dudley Digges, was found impossible to land and comply with the instructions of the Secretary of th Navy, as heavy ice intervened between the vessel and the shore. Running close t the coast, we passed Wolstenholm Sound, between Wolstenholm Island and Cape Atho and leaving the latter on the starboard quarter we ran up to within five or ten mil of Fitzclarence Rock, where the vessel had her first trial of working ice, in pushin through it from Fitzclarence Rock to Cape Parry, at the latter, where she entered th open water again by holding more to the westward. Passing Northumberland Islan at a considerable distance west, the Polaris without difficulty ran up to within a fe miles of Cape Alexander, and leaving at her stern in succession Port Foulke and Ren selaer Harbor, the winter-quarters of Dr. Hayes and Dr. Kane, she crossed Smith Sound and came within a few miles of Cape Hawks, where she encountered ice, but w rounded it by steering south and west; then running parallel with the coast until w arrived opposite Cape Frazer, she was stopped, and Captain Hall, accompanied by M Tyson, inspected the little inlet to the north of Cape Frazer for its qualification a either provision-depot or winter harbor; but finding it shoal, Captain Hall abandone all ideas of establishing his winter-quarters at the locality, and also failed to establi a depot. Keeping within ten or fifteen miles of the coast, we ran up Kennedy Cha nel, winding through more or less ice, until, in a thick fog, an ice-barrier appeared stretch across the channel. After several fruitless attempts, an opening was disco ered, which led us to within two miles of an island seen on our starboard bow. Fi or six hours later we found Kennedy Channel to be widening, and at about 9 a. Captain Hall and myself made observations for longitude, which, computed separatel determined the latter to be 64° 35′ west, (if my memory is not in error.) The fo shutting in, the vessel was stopped, until at 12 m. all persons capable of making o servations for latitude agreed our latitude to be 81° 24′ north.

At 1 p. m. the sky and horizon cleared, the vessel started, and then we saw, in pla of Kane's open Polar Sea, a long stretch of coast-line to the east of us, which, bare snow, sweeped in a shallow curve from north to south; the west side of the chann was also in sight, the general character of the land being torn and weather-beat rocks, with mounds of loose rocks and gravel in front of them. Steaming parallel t the east side of the channel, we, toward evening, entered a still narrower strait, whic received the name of Robeson Channel, called so by Captain Hall after the Honorab Secretary of the Navy. On we proceeded in this channel, passed a deep bay—afte wards called Newman's Bay—until hauled up a second time by an ice-barrier, whe Captain Hall ordered the vessel to be fastened to a floe, while I was busy computin the dead-reckoning from our last observation—81° 24′ north, 64° 35′ west—to the prese position of the ship. I was then invited to Captain Hall's room, and telling him th latitude, 82° 16′ north, and longitude, which I cannot recall, found, by dead-reckonin also temperature of atmosphere and surface-water, pressure of atmosphere, &c., h filled out two of the printed forms of records with a short extract of the expedition history, position of the vessel, data of weather and sea, and a statement of the fa prospects of still advancing further north. One of these records Captain Hall inclose air-tight, in a copper cylinder, previously weighted on one end with shot, and retaine the second copy. Only a short time the vessel remained fastened to the floe, when sh was directed to the east and south, until we arrived at the east coast, near a sma inlet. Here Captain Hall and Mr. Tyson visited the inlet, and examined it as to i qualification as a harbor, but found a strong action of the tide and ice working. Th vessel then steered back to the westward, and fastened to a floe, where she remaine all night. Early next morning the vessel returned to the above-mentioned inle Captain Hall and Mr. Tyson re-examined it; but finding their opinion of the prece ing day corroborated, Captain Hall called a council of the ship's officers to deci upon the further course of the vessel, and enjoined me to record the proceedings of th council. During this council all the officers, with the exception of Captain Buddin ton, expressed the same opinion, according to which the vessel should be directed nor and west, endeavoring to find a lead north, and, if not successful, to make the west coast and a harbor thereon. Captain Buddington's opinion was to enter the above-mentioned inlet, afterwards called Repulse Harbor by Captain Hall, and establish winter quarters; or, if not disposed to do so, to run south to what afterwards was called the Southern Fjiord, and anchor behind the island at its entrance. Captain Hall decided in favor of the majority, and the vessel slowly worked through ice on a course a little to the north of west, but instead of gaining lost ground in latitude. Finally, fog shut in, she was fastened to a floe, and soon got beset by heavy ice. In this condition she remained four days, during which time she continually drifted to the southwest. While beset, the vessel at times would labor under such heavy pressure that Captain Hall twice thought it necessary to deposit stores and provisions on the floe. On the evening of the fourth day of drift the ice spread, and the Polaris steamed on a nearly due east course to the shore and anchored in a shallow inlet, which received the name Thank God Harbor, called so by Captain Hall. This inlet could hardly be called a harbor, and the only protection against the grinding ice the Polaris found, was a large grounded iceberg, to which Captain Hall gave the name of Providence Iceberg. Next morning stores and provisions were landed, and the determination of latitude and longitude was commenced by Captain Hall, Mr. Bryan, and myself.

A few days after our arrival at Thank God Harbor, Captain Hall enjoined me to at once survey it, which I executed by surveying from the southeast cape of Robeson Channel, called Cape Lupton by Captain Hall, to the northeast cape of the Southern Fjiord. Thank God Harbor is formed by low, sandy land, which evidently is an alluvion from the hills to the northeast of it. These hills vary from 900 to 1,300 feet in height, are of slate formation and very much torn and weather-beaten, but bare of snow in summer. The water of the harbor is shallow—fourteen or fifteen fathoms being the average depth.

On our arrival at Thank God Harbor we found it thickly populated by geese and ducks, but they were missing next morning. While engaged at the survey of Thank God Harbor I met with two accidents which nearly terminated my earthly existence.

One morning, going out with the intention of stationing myself on the summit of the hill north of the vessel, deeply in thought, I took the wrong route and soon found myself on an almost perpendicular portion of the hill; endeavoring to climb up I lost my foot-hold, and was precipitated down a height of at least 200 feet; a heavy stone rolling down behind me caught my coat and stopped my involuntary descent, saving me from finally bringing up against a rock. At another time, in company of Mr. Bryan and Mauch, I crossed Polaris Bay to its south coast on the newly-formed young ice, and when returning Mr. Bryan and myself in succession fell through a crack, and were only saved from being drowned by rendering assistance to each other; and from freezing to death, by keeping on a sharp pace until our arrival at the ship, when Mr. Bryan, almost entirely used up and insensible, had to retire to bed immediately. Mauch had stayed back, and when finally arrived at the vessel he was staggering, out of his senses, and hardly able to keep himself up.

Soon after, Captain Hall sent out a sledge journey under command of Mr. Chester and accompanied by Dr. Bessels; this expedition traveled about fifteen miles south, and from the range of hills on the south coast of Polaris Bay saw a glacier extending east and west as far as eye could reach; they also found an elevated plain bearing to the northeast, between the range of hills northeast of Thank God Harbor, and those at the south coast of Polaris Bay, and shot a musk-ox. Captain Hall now prepared for a sledge journey, but was not quite ready until the 10th of October, when he issued orders to Captain Buddington and Mr. Morton in reference to the command of the vessel and provision matters, and started with two sledges, accompanied by Mr. Chester, Joe and Hans, with the intention of a two weeks' absence. The object of this journey was to reconnoiter the land as to its qualification as a route to be taken in spring, and to get acquainted with the resources of the country. During the absence of Captain Hall, the observatory was erected and fitted out; when he returned, on the 24th of October, 1871, we were ready to commence all observations prescribed by the instructions of the National Academy of Sciences.

From what I learned afterward, Captain Hall had been to Newman's Bay by way of the elevated plain mentioned above, and traveling to the entrance of Newman's Bay, ascended the cape, on the northeast, and deposited a record at the summit of said cape.

Soon after Captain Hall had set foot upon the vessel he was taken ill, complaining of the stomach, and retired to bed; next morning his left side was found paralyzed, and he remained in this state for some days, when he became better, left his bed, walking about in the cabin, and having his secretary, Mauch, read to him; he then had a relapse, took to the bed again, and became delirious, in which state he remained until the 8th of November, 1871, when he died. The remains of Captain Hall are interred at about half a mile to the southeast of the ship's anchorage; the place of interment was marked by a flag, the solidity of the frozen ground not permitting the erection of a board until the spring following. The engraving upon the board gives the principal achievements of the expedition, the age of Captain Hall, and date of his death and burial. During the summer of 1872, I included Captain Hall's grave in the general survey of Thank God Harbor, by reference to three points previously determined by the theodolite and chain.

After Captain Hall's death, Captain Buddington assumed command of the vessel, and jointly with Dr. Bessels issued a proclamation, wherein they stated that the provisions made by the Secretary of the Navy, in case of Captain Hall's death, should be carried out; that Captain Buddington would have the command of the vessel, while Dr. Bessels was to direct all sledge journeys and scientific operations. Arctic night had then set in, and scientific observations at winter-quarters had commenced; the vessel had been housed in under canvass and banked in with snow. During the entire dark winter, the members of the scientific party were busily engaged in carrying out the instructions of the National Academy of Sciences, while all others had to content themselves with active exercise on the ice and the reading of books of instruction and fiction. No marked incident or accident occurred during the four and a half months' darkness, with the exception of one soon after Captain Hall's death. During a severe northeast storm, the ice, wherein the Polaris had bedded, broke up, the anchor-chain, also frozen in, was carried with the ice, and the anchor dragged; it therefore was found necessary to unshackle the chain, and the Polaris drifted to the southwest, bringing up against Providence Iceberg, to which she was secured by ice-anchors. The northeast storm, the original cause of this accident, lasted three days, and had commenced two days before the vessel broke out; it started as a high wind during my watch at the observatory, and increased to a tremendous gale during Dr. Bessel's watch.

Waking up in the morning, I found the vessel laboring heavily, and from different sides heard fears expressed of Dr. Bessels's safety. I therefore got a few victuals to take with me, and left the vessel; but struck by the gale, I found it impossible to stand up, but had to be content with making my advances on all-fours. Dark as it was, the snow drifting so as to enter through clothing and lodge near the skin, I could not see but one yard ahead of me; and if, by inclining my shoulder too much either to left or right, I once took a wrong direction, it was more than likely that I never would see again either observatory or ship. Steadily I advanced, and soon had the satisfaction to arrive at a pole, erected in line with the observatory and ship, close to the beach. I now endeavored to crawl up the ridge to the observatory, but was driven back by the wind a number of times, until finally I succeeded in getting under the lee of the provision-depot, and from there to the observatory. I found Dr. Bessels shivering with the cold, (—28°,) and anxiously waiting for an opportunity to return to the vessel. He had made several attempts to return, but the fearful tempest had defeated his physical strength. He had registered the meteorological features of the storm until a light could not be kept burning any longer, the wind blowing at the rate of fifty-eight miles per hour, and still increasing.

Soon after my arrival at the observatory the two natives entered, having followed me, but lost their route. We then all started for the vessel by sliding on the ice, driven by the wind; when the ship loomed up we were within a few yards of it; all arrived safely at the Polaris without injury, excepting a few slight frost-burns.

Soon after the northeast gale's abatement a southwest storm sprung up, which, by driving the iceberg inshore, caused a heavy pressure on the vessel, so much so that Hans and family sought refuge at the observatory. During the entire winter the vessel had a list to starboard, and thereby strained her stern and bows, which were found to be in a leaky condition as soon as the ice around the vessel commenced to melt.

On the 28th of February, 1872, the sun made his re-appearance, but was then nearly 2° high at 12 m. I never before saw such enthusiasm and rejoicing over a sunrise as on that occasion; and I especially recall the carpenter, who during the winter had shown symptoms of insanity, carrying around a bottle of claret, which he had preserved during the entire winter, and inviting everybody to drink with him. And, indeed the sun's rise, after four and a half months' absence, was a matter to rejoice in. I think everybody had felt the influence of the absence of light by losing appetite, sleeplessness, and depressed spirits.

Dr. Bessels now officially communicated with Captain Buddington, making the following propositions: As soon as daylight is sufficient, to start two different sledge parties, one north and the other south; the southern expedition to connect our survey with Cape Constitution, and to consist of one sled; the northern expedition to proceed on the strait ice, with two sleds, and to make land, if possible, north of Polaris Bay, and to proceed from there either along shore or on land farther north; the vessel, as soon as broken out, to make her way in the same direction, and come to the relief of the northern expedition. These propositions were rejected by Captain Buddington in an official communication, stating that as soon as small leads occurred he would start to the north in two boats. This decided the question, and we all were anxiously waiting for the occurrence of those leads.

Early in spring the natives and Mr. Chester made several hunting-trips on sledges to Newman's Bay, and always returned, sledges loaded up with meat, leaving the greatest part stored at Newman's Bay.

Dr. Bessels, Mr. Bryan, Joe, and Hans traveled south, crossed the Southern Fjiord, and proceeding from there about forty miles farther south, Hans recognized Cape Constitution at some distance south. A wide crack in the ice stopped the party from visiting the point itself; while in the Southern Fjiord to some distance they saw no head to it, and treasured a great number of important fossils at the island in the entrance of the fjiord.

About this time I undertook a journey to Newman's Bay for surveying purposes. Newman's Bay is about forty miles deep, and from seven to twelve miles wide, with hill-ranges on either side of the entrance and head. In the middle of its length it is bound by an elevated plain on the west side, and by plains, in terraces, on the east side. On these terraces I traveled to about latitude 82° 09′ north, longitude 57° west, and surveyed as far as the eye could reach. I was stopped by want of provisions, which had been provided by Captain Buddington.

In June water was making around Cape Lupton, and Mr. Chester, returning from reconnoitering, reported in favor of the dispatch of two boats, which were sledged to Cape Lupton, and placed under command, respectively, of Mr. Chester and Captain Tyson. Dr. Bessels accompanied Mr. Tyson, and I accompanied Mr. Chester. The morning following our arrival at Cape Lupton, Mr. Chester took to the water, and by rowing and driving over the ice the boat and provisions, we succeeded in reaching a point on the coast three or four miles north-northwest of Cape Lupton. Here we pulled the boat up on the ice, and a watch was set. The men laid down in a tent, while Mr. Chester and myself slept about five yards from the tent and boat.

Early in the morning next day we were roused by the man on watch, who first reported that water was making round us, and then that an iceberg, propelled by a heavy floe, was coming upon us; but before he had finished his report the ice broke between the ice-hook holding the boat, and the boat started to drift; the man on watch leaped the crack and returned to the boat, then in danger of capsizing with the ice and laboring under a heavy strain from the rope holding it to the ice-hook. The rope had to be parted; the boat and tent drifted off with the crew, while Mr. Chester and myself remained near shore on the remainder of the original piece of ice, which soon was crushed by another and heavier piece rising to a vertical position and falling down on the former; we narrowly escaped to the shore-ice. A similar fate awaited the piece with the boat and tent on, and when this occurred the crew was just in time to reach the shore-ice. I then saw that the boat, although crushed, was partly held up by the ice underneath. I at once leaped over to her, having asked to be warned of any roll or motion of the intervening small ice. Most of the crew followed, and we succeeded in saving part of our clothing, some provisions, and nearly all instruments. Several times the ice started to roll, and some of us came very near being crushed by the ice. We then returned to the vessel, and on passing Cape Lupton found Captain Tyson had not started yet.

Mr. Chester procured permission from Captain Buddington to make a second attempt with the canvas boat, and in the course of a few days we were ready, and sledded the boat to Cape Lupton, where we immediately took to the water, pulled a few miles, but finally were compelled to haul up on a big floe. A heavy north breeze sprung up; the pack-ice closed around us and intervened between floe and shore. Here we remained an entire night, drifting rapidly south, and convinced that, if the ice kept closing in on us, we would have to stay on the floe and finally fall victims of starvation. I endeavored to cheer my comrades, but without avail. Thinking this a second failure, their spirits were depressed; nevertheless, we laid down on the ice and slept until morning, when the ice spread, and we at once launched the boat in the midst of this ice, and during the following twelve hours made our way to Newman's Bay, where we found Captain Tyson, having pulled up his boat on the bay-ice. As no further progress could be made, heavy pack stretching across the channel from Newman's Bay to the west coast, we also took up our quarters on the bay-ice, and remained there during the following six weeks, patiently waiting for an opening to the north.

Almost every day, while on this stationary bay-ice, I would observe that with the ebb a streak of water would form between bay-ice and strait-ice, extending in a semicircle from Cape Brevoort to Sumner Headland. We have to be thankful for many narrow escapes while on this bay-ice. I will only mention two cases, which occurred at almost the same time to each boat, separately. At midnight of some day in the first part of July, the heavy strait-ice closed in upon the bay-ice with such a heavy pressure that it rose vertically alongside of us, and we were compelled to desert skins, and rapidly remove boat and stores, while most of us had no time to protect our feet by either stockings or boots. During the same night a part of the bay-ice, from which Captain Tyson and boat had removed the preceding afternoon, was crushed to splinters by the grinding strait-ice. I have often wondered how careless the adventurer will become when once used to dangers. Similarly to the inhabitant of a large city, who in case of fire will not think of his own safety until the walls of his residence have caught the flames, the arctic traveler, hearing a constant cracking directly under himself, will not stir until he actually sees the ice breaking.

During my stay at Newman's Bay I crossed the bay-ice, and, ascending the northeast coast of the bay, traveled on the east shore of the channel until I reached the northern limit of Repulse Harbor, where I staid four hours, in order to determine latitude and longitude, and to take bearings of all land visible. The station I had selected was elevated somewhat above 1,700 feet, and the horizon, at such an elevation, forty-five miles distant, from north to east-northeast appeared as a continuous bright line of dark blue, glittering in the sunlight. Although seen by other observers, and declared to be land, I cannot but announce this bright line to be a sure sign of an open sea. No elevations were seen; and if there is any land to the north and east-northeast of Repulse Harbor it cannot but be at a considerable distance from where I was viewing the surroundings. The space between this bright line and place of observation was filled with smooth cakes of ice, with serpentine leads of water between them. I started homeward, under the impression that any strongly-built steamer, when once forced through the ice, barring the narrowest part of Robeson Channel, might at full speed run up to this bright line and there find open water for further progress. I had some difficulty in finding our boat among the hummocky ice, and when finally arrived I became snow-blind and remained so for several days.

The question may arise, why I did not proceed farther north while traveling on shore. In answer, I have to state that, while at Newman's Bay, we from day to day expected an opportunity to start north by boats, and therefore I did not want to stay away from the boat longer than twenty-four hours.

In the first part of July, still hoping for success, we got rather low in provisions, and two of our crew volunteered to travel over land to the ship and return to us with additional provisions. They did so; and soon after Hans, with a note from Captain Buddington, appeared at our encampment, and returned to the ship with Dr. Bessels. Captain Buddington's note requested our presence at the vessel, and ordered Messrs. Chester and Tyson to return to the ship with boats and crew. In answer, Hans took a note to Captain Buddington, wherein Mr. Chester stated that at present the ice would not permit a return of the boats. A few days later our two men returned with provisions, stating that the vessel had broken out in June, was very leaky, and that Captain Buddington wanted our presence, so as to enable him to pump the vessel by hand. They also related that Captain Buddington had made several fruitless attempts to take the Polaris up to Newman's Bay for the relief of the boats, and that the vessel was under anchor at Thank God Harbor. At these tidings Captain Tyson, with the assistance of the two boat's companies, excepting Mr. Chester, who staid with our boat, dragged his boat and provisions to the southwest shore of the bay and secured it on low land, surrounded by hills and the mouth of a deep and serpentine ravine, at this season a torrent, which I think is identical with the river mentioned in Captain Hall's dispatch. Captain Tyson and his boat's crew returned to the vessel overland, while Mr. Chester and company staid, waiting for an opportunity to go either north or south in the boat.

About the middle of July a heavy southwest gale set in, and if we had not departed from our encampment before the high wind increased to a gale we undoubtedly would have been crushed. Mr. Chester, with the boat and crew, at once started for shore. I shall never forget that day; I thought it the hardest of my life until later on our ice-drift. The canvas-boat, mounted on runners, we would pull against the storm, which was strong enough to lift boat and all, and in spite of our exertions to the contrary would carry us backward with the boat. We took the boat apart, so as to offer less surface to the wind; we partly unloaded the sleigh by depositing our clothes-bags and some provisions on the ice; but before we succeeded in reaching shore the bay-ice broke up, and we had to continue our work over drifting pieces and wide cracks of water. Finally we got the boat close to shore, and all hands returned in search of the stores deposited on the ice. By partly swimming across cracks we succeeded in finding the deposit, and loading ourselves with some fifty to seventy-five pounds each, returned in the same manner, arriving safely on shore, while the boat remained on the ice. We hardly had set foot on shore, at Captain Tyson's depot, when the gale increased still more, the ice left shore altogether, and a removal of the boat to shore was impossible. We erected the tent belonging to Captain Tyson's party, but shortly after it blew down, and we sought shelter in the boat of Captain Tyson. Even with the heavy load of provisions, clothing, instruments, and six men, the boat would be lifted up by the wind, and rolling on the beach, knocking against rocks, so as to break her skin in several places. We therefore capsized her, and putting a sail over her loaded her down with heavy stones, and passed the night without protection against the fearful gale. Two days later we all returned overland to the vessel, with the exception of one man, and Mr. Chester, who staid with the intention of bringing the canvas-boat back to shore as soon as the ice would return to the beach. When I started for the vessel the hills were bare of snow, with the exception of small ice-patches in the shaded corners of ravines; but when about half way, a snow-storm set nd compelled me to take up night quarters in the lee of a small rock. Next morn- it cleared up, and I readily found my way to the Polaris. The vessel was fastened heavy piece of ice; had, during my absence, narrowly escaped from being crushed 'rovidence Iceberg falling in; had been aground a number of times, pressed up by ice, and was said to be in a very leaky condition.

ptain Buddington intended to direct the vessel south as soon as a lead would occur. took place on the 12th of August; the same day little Francis Polaris, son of Hans stian, was born on board the vessel. The Polaris steered west, working through ice, then rounding heavy pack to the north she entered a lead which permitted o keep at full speed until next morning, when she brought up against a barrier of n Kennedy Channel, to the north of the small island on the west coast, in about ude 80° 40′ north. Having drifted past the small island, we from 10 p. m. August 6 a. m. August 14 pressed through heavy pack. At 12 m. of the latter day we again ed, and making a good progress at full speed of steam we passed by what both Mr. on and Hans declared to be Cape Constitution, in about latitude 80° 27′. Cape titution exhibits a peculiar form, and will serve as a landmark not easily forgotten by the poorest memory, and I am convinced that Mr. Morton and Hans are per- sure that what they declared to be Cape Constitution, really is the place named Dr. Kane.

midnight, August 14–15, fog set in and we fastened to a floe, which proved a bar r further progress. Until August 26 we drifted with the same floe, more or less , then steamed a short distance to northwest and fastened to another heavy floe, h, with the vessel, drifted south until October 9, when we found ourselves opposite Bay, about ten miles from shore. Drifting west and south, we entered Smith t and soon passed by Cape Alexander.

tober 14 was a thick, gloomy day, and on the afternoon of October 15 a heavy and southeast gale set in, which proved disastrous to the greatest part of the At about 5 p. m. it was reported to Captain Buddington that the ice at the oard was setting off; all of us at once went on deck, found matters as stated by an on watch, and saw two icebergs, which evidently had caused the separation ice; large floes passed by, the ship laboring under heavy pressure, so much so make her crack and tremble. Captain Buddington gave orders to heave out on the provisions, clothing, and valuable papers, constantly kept in readiness on deck. at time the vessel was raised to at least six feet from her water-mark.

t of the crew, Captain Tyson in charge, went out on the ice to collect the and carry them to a stronger part of the floe. Working on board, hard and , I finally left the vessel on the stern-line, intending to secure a bundle of books, had fallen close to the floe's edge, and then return to the ship; but while ng this bundle to a safe place, the ice broke up, the stern-line parted, the bow r slipped off the ice-anchor, and the vessel drifted off. Command to pull the over to the remainder of the floe was given, and when accomplished every- picked up whatever he could lay hands on. I jumped back to one of the small , endeavoring to find the box containing my papers, but without success, and I could return water intervened between me and the large floe. Seeing the close by, two others and myself entered the same, and with a kiak-paddle pro- the scow across the crack to the boats. Voices, coming from other small ice were heard, and the scow sent to the relief of those parties; but having shipped t amount of water the scow sunk close by the men she was to relieve, her crew vly escaping to the ice. One of the boats finally succeeded in collecting all hands n the ice upon the large floe. The gale still continued, snow drifted at a furious nd darkness inclosed us; the floe continued breaking up at the edge, and a con- removal of our stores was found necessary. We worked hard and steady until when, exhausted, we lay down on the ice, amidst the drifting snow and ex- o the fearful tempest. The papers, which had left my possession, consisted of lowing:

ivate letters and documents.

ecord of meteorological observations, reduced and corrected.

ook of comparisons, for the correction and verification of meteorological instru- and observations.

ble of relative humidity and dew-point for indications of the wet bulb, between —50°.

story of the expedition, in journal form.

eteorological journal, containing a detailed record of occasional observations rt discussions of marked meteorological phenomena.

tronomical and geodetical observations, including surveys of all land discovered rected.

servations on magnetic declination at numerous localities.

servations on horizontal intensity of magnetism at Thank God Harbor by the- magnetometer.

otanical collection of plants between latitude 81° 26′ and 82° 07′ N.

11. Topographical map of Thank God Harbor and Polaris Bay, secured in a tin cylinder.

The morning following our disaster we found our floe wedged in between an iceberg and Northumberland Island and water apparently leading to the island. We made two attempts to reach the island, but in both cases ice intervened. The last attempt was made after we had seen the Polaris rounding Cape Robeson, directing her course to Northumberland Island, and finally disappearing behind the same, without coming to our relief. At this second and last attempt we even had to abandon one of the boats at the opposite edge of the floe, and return to the other boat and provisions.

While on her way from Cape Robeson to Northumberland Island the Polaris once stopped, perhaps engaged in picking up provisions and the papers of Mr. Bryan and those belonging to me. After our second attempt to reach shore a heavy northeast gale set in, and next morning we found ourselves in the middle of the strait and on a small piece of ice which had broken off the large floe. With the large floe we lost the second boat, some provisions therein, a large canvas hut erected previous to our separation from the vessel, and six bags of bread stored in the hut. When the gale abated an inventory of the stores was taken and found as follows: several bags of clothing; several musk-ox skins; thirteen cases of pemican; fourteen hams; some canned meat; a small bag of chocolate; an A tent; instruments and a chronometer.

During the first two weeks of our stay on the ice, while drifting between Northumberland and Wolstenholm Islands, we built snow-huts and lived on seal-meat. Seeing that we might possibly exist during the entire winter even without fire and sufficient food, I ever afterwards nourished the hope of safely arriving at some port of Greenland during the following spring or summer.

The company laboring under such trying circumstances consisted of the following: Captain Tyson, assistant navigator, &c.; Fred. Meyer, meteorologist, &c.; John Heron, steward; William Jackson, cook; E. W. C. Kruger, Fred. Jamka, William Lindeman, Fred. Anting, Gustavus Linguist, Peter Johnson, seamen; Joe Eberby, Hannah, his wife, Punny, his child, Hans Christian and his wife, Augustine, Tobias, Succi, and Francis Polaris, his children, Esquimaux; in all nineteen human beings.

On October 23, while close to Wolstenholm Island, our large floe was sighted, and at once all hands, accompanied by the dogs, went over to the same on the young ice. In the course of a few days we succeeded in bringing across to our encampment the second boat and provisions therein—six bags of bread, canvas and wood forming the large hut.

On the 28th of October the sun departed to his winter rest, leaving us to the mercy of the dark, dreary winter night. During the month of October the natives succeeded in shooting three seals. On November 1st an attempt was made to reach shore at Dalrymple Island, but we only succeeded to arrive, with boats, provisions, and one kiak, at the large floe, while on October 2 we drifted out off Wolstenholm Sound, and on October 10 we had passed the Carey Islands.

We settled down on the large floe, built snow-huts, and lived on bread and pemican; in all twelve ounces per day, which was warmed with a quart of water on a wood-fire—for firing material we cut up one boat—was issued to us in two meals; the natives, whenever the weather would permit, went out hunting. During the month of November they killed five seals. Heavy winds prevailed, and we often were entirely blockaded with banks of drifted snow. On the 30th of November we sighted land, extending south from Lancaster Sound.

The month of December was mild, and we drifted so rapidly south that on December 21 we had light sufficient to read print during four hours of midday, and on December 7 I approximately determined latitude and longitude by λ. Cassiopeia to 74° 04′ north, 67° 53′ west; several bears and bear-tracks were seen, two white foxes and one seal killed; but in general we lived on the usual allowance of twelve ounces of bread and pemican, warmed up. In order to enable us to issue our provisions by weight, I previously had constructed a scale, by connecting a fine, three-cornered scale (rule) with a lever balance, taken from a broken aneroid, and attaching to the ends of the scale on cords two pasteboard boxes of equal weight; the weights I formed of chamois-skin and shot, taking as unit the weight of the meat contained in a one-pound can, and successively dividing it into half-pounds, four ounces, two ounces, and ounces.

On December 30 we sighted the west coast at a considerable distance. Approximate latitudes and longitudes were determined on January 6 by Polaris and λ. Cassiopeia to 72° 09′ north, 60° 41′ west. On January 20, by the same stars, to 70° 02′ north, 60° 01′ west. On January 27, by the same stars and the sun, to 69° 32′ north, 60° 03′ west. On the 19th of January the sun was seen above the horizon during the course of two hours, and very likely had been out the day previous, but obscure to our sight by an iceberg bearing south.

On the 5th of January we had used up one boat, and from that time we warmed our meals on an Esquimaux lamp. January was stormy and cold; during this month we drifted very rapidly, and shot five seals. On February 5 I approximately determined, by the sun, our latitude to be 68° 50′, and on February 19 Cape Walsingham nd neighboring land was in sight; preparations for an attempt to reach land were ade, but this plan finally was abandoned, and a reduction of our daily ration to seven unces found necessary, so that our provisions might hold out until the first of April. ebruary was mild but very stormy; during this month we drifted rapidly; six seals nd a great number of dovekies were shot; unicorn, bears, and bear-tracks seen. March as stormy and changeable in temperature; during this month a great number of seals, ome dovekies, and one bear were shot, and a number of unicorns seen. We lived in a tate of continual anxiety, the ice around us broke up, our floe parted into small pieces ntil we were confined to a space of about twenty yards in diameter; many nights we ared not sleep, fearing the ice would break under our feet and we would find our grave n the Arctic Sea.

Finally, on the 31st of March, our encampment became wasted out to such an extent hat, on the 1st of April, we took the water, in the boat, endeavoring to penetrate the ack, where we expected to find protection against sea and weather. On the 12th of arch we were in latitude 64° 32′ north; on the 13th in 64° 19′ north; on the 17th in 3° 47′ north; on the 22d in 62° 56′ north, and on the 31st in 59° 41′ north; we sighted o land during this month. From April 1 to April 4, inclusive, we at times had leads f water to south and southwest, which permitted us to proceed by oar and sail several iles each day; but April 5 to 20 we staid on one and the same piece of ice, surrounded y pack, and laboring under heavy-sea swell, which caused us much anxiety. Fre-uently we dared not sleep, for fear the ice would break under our feet, or the sea wash s off the ice. Several times the ice broke close to the boat and tent, and once nder the tent, while all of us were inside of it eating breakfast. At another time, hile half of us watched and the other half slept, the ice broke between the boat and nt, and the general outcry was to stay with the boat; but on looking around I found yself alone with the boat, all others having staid with the tent and provisions. I et the kiak adrift; but it drifted in a direction opposite to where my comrades were. endeavored to push the boat, which was heavily loaded, off the piece of ice; but before I ucceeded the two natives, propelling a small piece of ice by a paddle, approached me. I hrew out a line, and pulled them up to me. We, all three, succeeded in getting the oat off, but I had the misfortune to go with it and fall in the water. Only a short istance from where we had started the boat got beset by pack-ice; after three hours' ard work we succeeded in pulling up the boat on a piece of ice half of her size. There e staid all night, and I, being wet through, was never before so near freezing to death; ost my breath for some time, but finally restored circulation of blood by a rapid motion f hands and feet. At daylight we saw our comrades and tent about half a mile off. Cap-ain Tyson and some of the crew came over to us on the pack-ice, and working all together e dragged the boat back to the tent; the kiak was found a short distance from the nt and also saved.

In the night from the 19th to the 20th of April we were washed out of the tent, which as lost, and we had to cling tightly to the boat during the entire night, or it would ave been washed off the ice, which actually took place, in carrying boat and men hang-ng to it from one side of the piece to the other, while ice-blocks three feet square pelted gainst the boat and our legs. At last we launched the boat and arrived safely on a lain but smaller piece of ice, which did not labor much under the heavy sea. On this iece the pack-ice again closed around us, and on April 22 our provisions consisted of nly ten biscuits. Starvation was before the door. Then Providence directed a bear to ur encampment, and, while all others hid themselves, Joe and Hans from behind a ummock shot the bear. We then crossed over the pack-ice to the place where the ear breathed his last, fastened a line to him and pulled him to our encampment. From his time until finally relieved by the Tigress we had an abundance of meat, which we enerally ate raw.

From April 25 to April 30 we had more or less opportunities to proceed by boat, but hen on the ice, the sea washing over it, we were compelled to sleep in turns of half ur number.

On April 28, while proceeding in the water, we saw a steamer crossing our course at ome distance. The flag was immediately hoisted, but at dark the vessel was out of ight. Next day we again saw a steamer, launched the boat and proceeded by oar ntil we arrived at a barrier of heavy pack, when we pulled up on a cake of ice, set ignals for the steamer and fired shots. Four shots fired from the steamer were heard y us, and taken as answer to our signal-shots; but herein we were mistaken. Toward vening the vessel was lost out of sight. The morning of April 30 was thick and foggy. aptain Tyson, myself, the steward, cook, and natives slept in turn from 12 m. to 5 a. ., when we were roused by the watch to take their place; but before we had shaken ff all drowsiness somebody cried out: "Here is a steamer close by." We all cleared he boat just in time to see the fog throwing his dark veil over the vessel so patiently oped for. Then Hans had the admirable idea of taking to the kiak and apprising the essel of our presence. The flag was hoisted, shots fired, and all hands hailed the ves-el at the highest pitch of their voices. I am unable to describe the sensation of relief hen I saw the steamer come to our encampment. All of us were taken on board the igress and treated hospitably.

April was mild but more or less stormy. During this month I have recorded a number of approximate determinations of latitude: On April 4, 56° 47′ north; April 9 55° 51′ north; April 12, 55° 35′ north; April 13, 55° 23′ north; April 14, 55° 13′ north April 15, 54° 58′ north; April 17, 54° 27′ north; April 21, 53° 57′ north; April 26, 53° 30′ north; April 28, 53° 04′ north. The Tigress, a sealing-steamer, pursued her voyag during the next ten days. She then took us to Bay Roberts, and from there to Sain John's. At Saint John's we remained two weeks, when the Frolic, United State man-of-war, arrived, and returned with us to Washington.

II.—SCIENTIFIC OPERATIONS OF THE EXPEDITION.

1.—ASTRONOMICAL AND GEODETICAL OBSERVATIONS.

The Bureau of Navigation had provided the expedition with six chronometers, three sidereal ones, and three solar mean time. A daily comparison, made at six hours Greenwich mean time, showed that their relative differences generally kept increasing, according t their primary rate. All comparisons with their first and second differences were recorded in a book which, under charge of Mr. Bryan, would be found among his papers. The chronometers were known by letters as "A, B, C, D, E, and Z," and Z was selected a standard; they were in a gimbal box, which again set in a cushioned box, and were three together inclosed in two wooden, cushioned boxes, which, fastened to the cabin-floor, set around the mast, but detached therefrom. Observing some of them on journeys while in charge, I gained some valuable experience. When, in June, 1872, whil on a journey to the north, the boat was crushed in the ice, I succeeded in saving chronometer "D." When gotten from the boat, the outside box was completely crushed, and still, when compared with a hack-watch, the chronometer had kept its rate remarkably well. "D," then, was carried overland to the vessel, and forgotten to be locked a comparison at its arrival showed a loss of nearly thirty minutes. Taken out again i the canvas-boat, our long stay on the bay-ice of Newman's Bay gave me an opportunity to ascertain the rate of "D" by observations on the prime vertical. In this manner I found that although "D" had a larger daily loss on the ice than on board, this daily loss would remain the same while on the ice. When finally compelled to return t shore during a southwest gale, "D" was left on a piece of ice, and during the entire storm exposed to the action of the waves, so that, when gotten the next day, the chronometer was found reversed; but compared with a hack-watch, the chronometer showed to have preserved its ice-rate.

A.—*Astronomical observations at winter-quarters.*

Preliminary observations, with sextant and artificial horizon, for latitude and time were made on shore of Thank God Harbor the day following our arrival by Captain Hall, Mr. Bryan, and myself; carefully computed, and using the primary rate of our chronometers, the position was found to be 81° 38′ north, 61° 44′ west—seconds I cannot recall.

During the winter, observations for latitude were made upon stars, both north and south of the zenith, with sextant and artificial horizon, whenever the weather permitted to do so. After the sun's rise in spring a great number of equal altitudes near its prime vertical and of meridian altitudes, both upper and lower culmination, were taken with sextant and artificial horizon, as also with the theodolite. A great number of the moon's altitudes were taken whenever this satellite was visible. The transit instrument was set up at the observatory (see pl. I. T.,) on a stout piece of plank, which rested on two trestles, their legs being sunk into the ground and frozen tight, and passing through the floor without touching it. All constants were not known, but easily found, with the exception of the division value of the level, which finally was determined in the following manner:

I. The height of a great number of threads of the screw, acting vertically upon the rotation axis, was measured, and thereby the height of one thread found.

II. The length of the level measured.

III. The inclination of the level, corresponding to the height of one thread, found by—

$l \sin x = h.$

$l =$ length of level.

$h =$ height of one thread of the screw.

$x =$ angular value of level inclination corresponding to h.

IV. Division value of level determined by finding the number of turns of the screw corresponding to one division of the level.

The instrument, once set up in close approximation to the meridian, remained stationary, but the azimuth correction was observed for at the beginning and close of each set of observations by transits of stars of twelve hours' difference in right ascension, one circumpolar and one equatorial. A great number of level-readings (reversals) were taken before and after each set of observations; but frequently the difficulty arose that the

le could not be made sufficiently small. Transits were timed by sidereal chronom-
'A," which constantly remained at the observatory, fastened in a box to the
it-stand; a meridian mark was not established. Moon transits were observed at
ccasions; also several occultations are on record. A great number of lunar dis-
s, especially such measured from the sun, were taken. The index error of a sextant
rally had to be determined before and after each set of observations, as great
larities, caused by change of temperature, were observed. The repeating circle
sed at times, but very seldom.

B.—*Astronomical observations on sea and in ports of Greenland.*

ween New London and Saint John's a great number of sun's altitudes were
red by Captain Hall for latitude and longitude. At Saint John's one of the chro-
er-watches was compared with a chronometer which had been rated shortly
, and this comparison recorded. Between Saint John's and Fiskenaes a great
er of determinations of latitude and longitude by sun's altitudes were made by
in Hall and myself, as also between Fiskenaes and Holsteinborg. At Holstein-
wo sets of observations for longitude, by sextant and artificial horizon, were
ed by Captain Hall and myself. All four sets when computed resulted in one
he same longitude within one second of arc. Captain Hall also obtained an
ation for the latitude of Holsteinborg. Observations for latitudes and longi-
between Holsteinborg and Godhavn are recorded, and at Godhavn Captain Hall
ed several sets for both latitude and longitude. At Upernavik observations
extant and artificial horizon were made by Mr. Bryan and myself. Altitudes on
eridian and about four hours from the meridian were selected. At Tessiusak
n Hall, Mr. Bryan, and myself made determinations for latitude and longitude.
en Tessiusak and Thank God Harbor a great number of sun's altitudes, for the
ination of latitudes and longitudes, were made. The last observation on sea
ade for latitude by all persons capable, and for longitude by Captain Hall and
; the result I think was 81° 24′ north, 64° 35′ west. Between Thank God Har-
d Northumberland Island a great number of observations on latitude and longi-
vith sextant and artificial horizon, were made by Mr. Bryan and myself. Those
y me while drifting in Smith Sound are now in my possession, and, together
earings of headlands, appended in Paper I; they generally are taken on the
ertical, so that latitude and longitude deduced therefrom refer to one and the
osition. In Paper I, I give resulting latitudes and longitudes, having applied
nary correction and rate of chronometer "Z" from memory.

—*Astronomical and geodetical observations, forming a series of systematic surveys.*

k God Harbor and Polaris Bay were surveyed by me in September, 1871, with
odolite and plane-table. The plane-table was constructed under my supervision
Shuman, first engineer, in the following manner:
drawing-board was mounted upon the tripod, sent with the dip-circle, by a
lamp-screw.
ne round level of a chemical scale was detached therefrom, to be used in level-
plane-table.
round compass was sunk into a four-cornered elongated box, so that a line
ing N and S of the graduated arc would be parallel with the side of the box.
he telescope sent for observations of pendulum transits was mounted upon a
le, so that when placed upon a horizontal plane the telescope-axis would be
and in a vertical plane with one edge of the rule.
the commencement of operations with the plane-table, I obtained the co-or-
of three marked field-points by using chain and theodolite. All points are re-
the position "Observatory." I then entered upon the plane-table the three
entioned above, and point "Observatory," where I took my first station. The
eled and brought into parallelism with the field, a line marked "N" and par-
h the connection of N and S of the graduated arc of the compass-box and the
of the needle, was drawn, as also sight-lines to all points desirable to be taken
survey. The second station was taken three or four miles from the first, the
eled, the box-compass applied to line marked "N," and the table brought into
nate parallelism with the field. Then cutting in backward, a small triangle
obtained in place of the correct station-point. This station-point had to be
the right or to the left of all sight-lines forming the triangle, and its distances
se sight-lines had to be in proportion with its distances from the field-points
in forming the triangle, therefore a simple geometrical construction would
ne correct station-point, when the table could be brought accurately into par-
vith the field; sight-lines to all points, taken in at the first station, would be
c.
verification of this plane-table survey, I determined a point "D" twelve

miles from observatory, with the theodolite and chain, and found a sensible agreement of its determination by theodolite with that by the plane-table.

As soon as the survey of Thank God Harbor and Polaris Bay was completed, I drew an elaborate topographical map of the same before the disappearance of the sun.

During the spring and summer of 1872, I made surveys of the east side of the channel from latitude 80° 27′ north to 82° 21′ north; of the west side of the channel from latitude 80° 15′ north to about 84° north; of the interior, between Newman's Bay and Polaris Bay, of Newman's Bay, and to some extent of the interior northeast of Newman's Bay. All these surveys were executed by taking up a great number of stations at Polaris Bay, Newman's Bay, and intermediate points, determining their latitude, longitude, and magnetic declination by theodolite, and taking magnetic bearings to all points desirable to be taken in by the survey. In this manner between 300 and 400 points were determined and known by numbers. Sketches of coast-lines and hill-ranges, to serve as a basis for the detail of a topographical map, were also made. When, while going north, our boat was crushed in the ice, I lost the theodolite, and ever afterwards I took the bearings with a large azimuth circle, taken off a large prismatic compass. This azimuth circle, supplied with a vernier and sight-vanes, I mounted upon a tripod, and leveled it with a round level. Determinations of latitudes and longitudes had to be made with sextant and artificial horizon; for determination of magnetic declination, a prismatic compass was employed. In July, 1872, I visited the north side of Repulse Harbor, made observations for latitude and longitude with pocket-sextant, using sea-horizon, and measuring the elevation by aneroid. I then saw the west side of the channel bending to the south of west in about latitude 84° north, and the east side of the channel to the south of east in about latitude 82° 21′.

Repulse Harbor's latitude is about 82° 09′ north; its longitude between 58° and 59° west. The Southern Fjiord was to some extent surveyed by Mr. Bryan in the spring of 1872; its head has not been seen; and, when passing its entrance in the fall of 1872, on our route home, I was impressed that the Southern Fjiord was a channel in reality, and perhaps connected with "Emperor Joseph's Fjiord" of the German expedition. "Lady Franklin's Bay" also appears to be the junction of two channels separated by an island. While on our home route Cape Constitution was recognized by Mr. Morton and Hans. Observations made in its vicinity proved its latitude to be about 80° 27′ north. While drifting through Smith's Sound, a great number of astronomical observations, in connection with bearings to headlands, were made by Mr. Bryan and myself; those made by me are now in my possession, and appended in Paper I. On our voyage north, as well as our voyage south, it generally was felt that the west side of the channel, as laid down in Dr. Hayes's map, needed considerable alteration; not in the detail of the map, but in latitudes, longitudes, and general direction of coast line. Kennedy Channel at parts is very narrow, especially in the vicinity of Cape Constitution, where its width hardly exceeds from fifteen to twenty miles. Carl Ritter Bay, on Dr. Hayes's map, the northern extremity of Kennedy Channel, really is the southern extremity; the two sides of Kennedy Channel consist of land, which is mapped neither by Dr. Kane nor Dr. Hayes; the direction of "Humboldt Glacier," very likely, is not north and south, but northeast and southwest, &c. In plan (II.) I append a diagram of Smith's Sound, Kennedy Channel, Polaris Bay, Robeson Channel, and of the west coast to about latitude 84°. All records of astronomical and geodetical observations would be found partly among Mr. Bryan's and partly among my own papers. During the winter of 1871 to 1872, I constructed the ship's track between New London, latitude 82° 16′, and Thank God Harbor. The Polaris before she started had not been swung and her compass deviation therefore was unknown.

As from St. John's to latitude 82° 16′ our mean course was north, I approximately determined the deviation by merely computing the position in which the log, without the use of any deviation, would locate Fiskenaes at; the angular value of distance, "computed position and real position of Fiskenaes," with radius equal to distance. "St. John's and Fiskenaes" furnished the deviation which in proceeding north I varied proportionally to the tangent of the magnetic inclination. The limits of sea-currents I could very well determine by the change of surface sea-temperature, and by the combination of all meteorological instruments motion. It is very interesting that the state of atmosphere over the Labrador current, between Newfoundland and St. John's, as indicated by the combination of all meteorological instruments, is so marked and peculiar that I afterwards was enabled, without using the sea-thermometer, to exactly know when we entered the Labrador current between St. John's and Greenland, when we arrived at its center line, and when at its northern limit. In a similar manner I had all other currents indicated, compass deviation and limits of currents determined; the velocity of currents was found by dead-reckoning; astronomical observations made at latitude 81° 24′ north; longitude 64° 35′ west, and Thank God Harbor served as verification.

2.—MAGNETIC OBSERVATIONS.

A.—Differential observations, for the determination of diurnal variation of magnetic declination, were made at the observatory of Thank God Harbor. The theodolite magnetometer was used therefore in the snow-hut "M," (pl. I,) upon a stout wooden stand, which was solidly frozen into the ground; a thermometer was suspended from the stand. When first the instrument was set up, and the line of detorsion brought in coincidence with the magnetic meridian, it remained undisturbed during the course of four or five months, when hourly readings were taken by Dr. Bessels, Mr. Bryan, and myself, besides readings, at five minutes interval, on term days, prescribed by "Ridell, &c." During these observations the collimator magnet was suspended in a stirrup, constructed by Mr. Shuman, the original stirrup having been lost when the gale of November 22 blew down the snow-hut; only a single fiber was used during these experiments. The disturbances were large and frequent; and therefore the record of differential observations consists of scale readings, azimuth-circle readings, and thermometric readings, and is kept in one book, which will be found among Mr. Bryan's papers.

B.—Observations on absolute magnetic declination were made by Captain Hall at Godhavn and Thank God Harbor by prismatic compass, sextant, and artificial horizon. Captain Hall also recorded a great number of the sun's bearings with the course of the vessel while between Tessiusak and Thank God Harbor. Mr. Bryan made determinations of absolute declination at Thank God Harbor by theodolite magnetometer, and small theodolite, and, while drifting in Smith's Sound, by prismatic compass, sextant, and artificial horizon. His determination at winter-quarters with the theodolite magnetometer was made by reference to two very marked field-points, to which he had measured a great number of solar bearings. I made determinations of absolute declination by either small theodolite or prismatic compass, sextant, and artificial horizon, at Thank God Harbor, Polaris, and Newman's Bay, as also at a great number of intermediate points. While drifting in Smith's Sound I determined the declination at all times when recording magnetic bearing of marked headlands. Captain Hall's observations on magnetic declination are among his papers, and undoubtedly on board the Polaris. Mr. Bryan's determinations were in his box thrown on the ice, and are probably now on board the Polaris. Determinations made by me were in my box, and may also be found on board the vessel. The observations made while drifting in Smith's Sound are now in my possession, and will be found appended in Paper I. Declination at Thank God Harbor was about 96° west. Mr. Charles A. Schott, before the expedition started, prepared a map exhibiting the isogonic lines in the vicinity of the north pole, and I cannot but state that Mr. Schott's isogonic lines almost entirely coincided with those based upon our observations.

C.—Observations on relative magnetic intensity were made repeatedly at Thank God Harbor by Mr. Bryan, and will be found among his papers.

Observations on absolute, magnetic, horizontal intensity were made by me in the spring of 1872, at Thank God Harbor, and consist of—

Several sets observations on the zero divisions of collimator magnet and week magnet.

Several sets of vibrations with and without ring-weight.

Of the exact weight of the ring, found with a very sensitive chemical scale, and its dimensions.

Several sets of deflections at two distances.

A determination of the scale value of the collimator magnet.

All sets of vibrations are accompanied by observations on the co-efficient of torsion. These observations extend over the period of about eight days or longer, and their record will be found among my papers. During these observations the magnet, then in the original stirrup, which had been recovered in spring, was suspended on three fibers.

D.—Observations on magnetic inclination were made by Mr. Bryan with the dip-circle at Tessiusak, Thank God Harbor, and Southern Fjiord. At Thank God Harbor the inclination was determined very frequently, and all observations were recorded by Mr. Bryan, among whose papers they will be found.

3.—OBSERVATIONS ON THE FORCE OF GRAVITY.

During our stay at winter-quarters the pendulum was swung on the same knife-edges as previously at Cambridge and Port Foulke. Transits of the lower knife-edge over the vertical hair of a telescope, set at a distance of about twelve feet in coincidence with the zero of the graduated arc, were observed by Mr. Bryan and myself, relieving each other, while Dr. Bessels timed the signals given by the observers of the transits. The azimuth of the plane of vibration was nearly north and south; the box of the pendulum apparatus, placed at P (pl. I,) rested upon heavy planks, which were frozen into the ground; it was carefully detached from the floor and wall of the observatory, and supported by three steel braces, one in the back and one on each side. The plane supporting the knife-edge was kept carefully leveled; the semi-arcs, counted from the middle either way, frequently recorded, as also the readings of two thermometers, placed respectively at heights of the lower and upper knife-edges. Times of transits were marked by sidereal chronometer "A," whose rate was observed for, before and after these pendulum experiments, by Mr. Bryan. All four faces wer swung in strict compliance with the manuscript instructions prepared by Mr. Charle A. Schott. The readings of barometer are furnished by the meteorological record.

The record of our pendulum observations when completed was placed in the hand of Dr. Bessels, and undoubtedly is now on board of the Polaris; the pendulum itsel will also be found at the vessel.

4.—OBSERVATIONS ON OCEAN PHYSICS.

A.—*Observation on depth.*

Soundings were made in latitude 81° 24′ north, longitude 64° 35′ west, and at a grea number of positions in Smith's Sound. The record of two soundings in Smith's Soun is now in my possession, and, together with bearings of the positions to known head lands, appended in Paper I. The record of all other soundings is among Dr. Bessels' papers.

B.—*Examination of sea-bottom, procured by either dredges or soundings.*

Dredges were made at St. John's, and surface-dredges on the greatest part of ou route between Tessiusak and Thank God Harbor.

Sea-bottom was taken up with each sounding. All dredges and portions of se bottom were examined by Dr. Bessels; the results of these examinations are recorde among his papers.

C.—*Observations on sea-temperature.*

Surface sea-temperature was observed by Dr. Bessels and myself between New London, latitude 82° 16′ north, and Thank God Harbor, as also, while returning, betwee Thank God Harbor and Northumberland Island, at most times hourly, but sometime every three hours. They are very interesting and instructive in defining current Sea-temperatures at the bottom and intermediate points were recorded whenever a opportunity was offered to observe them.

The Miller-Casella's deep-sea thermometer proved useless when exposed to the colde waters and climate, the transparent liquid contracting disproportionately. All observations on sea-temperature are recorded, together with the systematic meteorological observations, and are among my papers; Dr. Bessels has an extract of sea-temperatur observations.

D.—Observations on the density of sea-water simultaneous with observations on sea temperature by hydrometrical measurements were made by Dr. Bessels and mysel Dr. Bessels also had a number of sealed bottles filled with sea-water of different localities and intended for chemical analysis.

E.—*Observations on currents.*

As I have stated above, the observations on currents were not directly made, bu indirectly, by observations of sea-temperature and meteorological observations; th velocity of currents could be deduced from the log. Along the coast of Greenland, a the season of July and August, observations on sea-temperature give very interestin indications. The sea-thermometer gives proof of a continual variation of surface sea temperature, nearly equidistant from the temperature of maximum density of salt water. Per example: at one locality we find the temperature +43°; not far from i we find it +35°; this shows that surface and under currents are intermingling, cause by their almost equal specific gravity.

Crossing Smith's Sound, and getting within the vicinity of the west coast, we me a cold current, directed to the southwest, which, higher up in Kennedy Channel Polaris Bay, and Robeson Channel, was noticed to take up the entire width of th straits. The direction of this current was beautifully illustrated by a line of iceberg seen in Smith's Sound, bearing northeast and southwest. The velocity of the curren I computed from the log, making use of our observations of latitude 81° 24′ north 64° 35′ west, and found it to be nine miles per day. This was afterwards verified b the computed distance between the position the vessel got beset in and the positio she broke out at, giving thirty-six miles for a four day's drift. The position she go beset in depended upon the observations of latitude 81° 24′ north, longitude 64° 3 west, and the log; the position she broke out at depended upon Thank God Harbo and the log.

F.—Tidal observations were made at Thank God Harbor by some of the seame with a tide-guage, constructed on Dr. Hayes's plan. These observations extend over th entire winter, from September, 1871, to June, 1872, are made at times every ten minute or half-hourly, or hourly, and their record is among Dr. Bessels's papers.

The rise and fall of the tide is small; the age of the tide nearly twenty-four hour

5.—METEOROLOGICAL OBSERVATIONS.

A.—*Observations on atmospheric pressure.*

uring the voyage from New London to Thank God Harbor, observations were made
ry three hours with a marine barometer and an aneroid; both instruments were
t compared with Green's standard barometer, No. 739 (?); the indications of the
ometer were very marked over every branch of a cold current, as also their gradual
rease and decrease in approaching or distancing the parallel of maximum pressure.
instruments were kept in a shelter, fastened to the port side of the wheel-house,
their indications corrected for temperature, elevation, and instrumental error. At
ter-quarters observations on atmospheric pressure were made hourly at the observ-
y with Green's standard barometer, No. 739 (?), and were corrected for tempera-
, elevation, and instrumental error. The elevation above the mean level of the sea
termined in the fall, and again in the spring, by the theodolite, and I constructed,
aplace's formula, a table giving the correction for said elevation at temperatures
+50° to —50°. All the barometers in the possession of the expedition I kept care-
compared; it frequently was found necessary to clean the mercury of No. 739 (?);
ll such occasions comparisons were made before and after its cleaning.

e motion of the barometer-column was very marked, with northeast and south-
winds, being very fluctuating and generally high, but falling with a northeast
l, and very low, but rising with a southwest wind. These indications are very sig-
ant, and varying according to season. In the fall, when an immense quantity of
ture is precipitated from the higher regions in form of fogs, frost, smokes, snow, and
ation of fresh-water ice on the sea, the barometer is very low; the same in spring,
active evaporation of snow, ice, and water is going on. Between Thank God
or and Northumberland Island hourly observations were made and corrected. A
er of measurements of elevations by aneroid I made at and between Polaris and
nan's Bay. Before I left Washington I compared Green's No. 739 (?) with the bu-
standard and Naval Observatory barometer.

—Observations on temperature were made every three hours on our voyage north,
hour on our voyage south, and at winter-quarters.

er my separation from the vessel I made some notations of temperature, which
ppended in Paper II. On our voyage north the influence of cold sea-currents over
spheric temperature was especially marked. On several other journeys, it was al-
observed that ice will form on the salt-water whose temperature is below 32°, even
the atmospheric temperature is +40° and higher. This ice-formation is congealed
water, which partly melts off the surface of drifting ice and partly condenses
on from atmospheric moisture. At winter-quarters I operated very carefully, in
to get true observations of atmospheric temperature. As soon as practicable
our arrival at Thank God Harbor, I made at the observatory a long series of com-
ns, at different temperatures, of all thermometers on board. Green's thermome-
fter application of their correction, previously determined at Washington, agreed
t to the tenth of a degree; especially two mercurial thermometers, of which I
ed one as standard. Casella's thermometers showed more or less irregularities,
, I think, was caused by their being encased in wooden frames. A great number
rmometers were suspended in the shelter "5," pl. (1,) on a revolving drum of
-work. The temperature was noted always by the standard, but at the freezing
mercury all thermometers in the shelter were registered, corrected according to
us comparison, and the most probable temperature of the melting of mercury
ed. The melting-point of mercury, by repeated operations, as described above,
und —39°.8. One of Green's spirit-thermometers most correctly showed the
ature of melting of mercury by applying the correction found from previous
rison. This thermometer I selected for the notation of atmospheric temperature
melting of mercury. Very annoying, in regard to the observation of thermome-
as the almost continual snow-drift, which, besides burying the thermometers en-
almost blinded the observer. I am astounded how quick a tolerable observer,
nder such difficult circumstances, will acquire the routine of just bringing the
f a lantern to bear upon a thermometer, and reading it correctly to one-tenth
gree during the period of one second. At Thank God Harbor the highest tem-
e observed was between +40° and +50°; the lowest temperature, —58°, oc-
in January, but March was the coldest month.

e fall, with a northeast wind, the temperature would rise; with a southwest, it
fall. In spring a northeast wind would be preceded by high temperature, de-
g after the northeast wind had set in; a southwest wind in spring was preceded
temperature, rising after the wind's arrival. In winter a northeast wind pre-
y low temperature would produce a slow rise; a southwest wind preceded by
perature would produce a rapid rise of temperature.

Observations on winds were made every three hours on our voyage north, every
our voyage south, and at winter-quarters. The direction of winds on board of

the vessel was determined by comparing it with the compass and application of ma netic declination. The velocity of winds was found by the anemometer erected on th quarter-deck, port side, or the current meter whenever the former was obstructed Between St. John's and New London one cup of the anemometer was carried over board, and as I wished to reserve one anemometer for winter-quarters observations, continued the observation of the anemometer, running on three cups, and deduced tru velocities from its indications by the formula—

$$V_x = V \frac{4\,W}{3\,W_x}$$

which I constructed in the following manner:

Let

P represent the force of wind, in pounds, on a square foot.
L resistance of atmosphere upon one cup during one revolution.
R friction at spindle while in motion on four cups.
R′ friction at the spindle while in motion on three cups.
a area of the half-sphere, forming the concave slide of a cup.
b area of the base of the cup.

During one revolution of a cup, the direction of the wind forms with the base of th cup all consecutive values of angles, (from 0° to 360°,) and therefore the force exerte upon a square foot of the cup at any time is expressed by—

$$P \sin z$$

but during half a revolution the wind exerts its force upon *a*, and during the othe half upon *b*; expressing the differential of *z* by *d z*, and the entire force exerted by th wind upon one cup during one revolution is equal to—

$$\frac{P \int \sin z\, d z\ (0-180)}{d z} \cdot a + \frac{P \int \sin z\, d z\ (180-360)}{d z} \cdot b = \frac{2\,P\,(a-b)}{d z}$$

and upon four cups, equal to—

$$\frac{8\,P\,(a-b)}{d z}$$

this force is diminished by the resistance of atmosphere 4 L and friction R, and th total force in action becomes—

$$\frac{8\,P\,(a-b)}{d z} - (4\,L + R)$$

In a similar manner, the total force in action upon three cups is equal to—

$$\frac{6\,P\,(a-b)}{d z} - (3\,L + R')$$

But, according to the law of inertia, two forces are proportional to the masses the set in motion; and also to the velocities they communicate to said masses. Expressin the mass or weight of four cups, stems and center-piece by W_x; the weight of thre cups, stems and center-piece by W; the velocity of four cups, under pressure P, b V_x; the velocity of three cups, under pressure P, by *v*, we will have the equation—

$$\frac{\frac{8\,P\,(a-b)}{d z} - (4\,L + R)}{\frac{6\,P\,(a-b)}{d z} - (3\,L + R')} = \frac{W_x\, v_x}{W\, v}$$

transforming—

$$\frac{8\,P\,(a-b) - (4\,L + R)\,d z}{6\,P\,(a-b) - (3\,L + R')\,d z} = \frac{W_x\ v_x}{W\, v} \quad \text{or}$$

$$\frac{4}{3} = \frac{W_x\ v_x}{W v} \qquad \frac{v_x}{v} = \frac{4\,W}{3\,W_x}$$

considering that the velocities of the cups at any time are proportional to the indica tions of the anemometer, and if we express the indications of the anemometer whil running, respectively, on four and three cups, and under influence of pressure P, b V_x and V, we have—

$$\frac{V_x}{V} = \frac{v_x}{v} = \frac{4\,W}{3\,W\,x} \qquad V_x = V\,\frac{4\,W}{3\,W_x}$$

At winter-quarters the direction of the wind was determined by reference to marke field-points, whose true bearing was known accurately. The anemometer was erecte at about fifty yards from the observatory, free of obstruction; the velocity of wind was hourly determined, and the number of miles for the preceding hour noted also.

In cases of doubtful observations or very light winds, the current meter was besides brought into action. Anemometers were always kept in the best order; Mr. Sherman, 1st engineer, repaired the spindles several times by replacing the brass tops by steel tops. Frequent comparisons of anemometers and current meter were made. The principal direction of high winds and gales at Thank God Harbor was northeast in fall and spring, and northeast and southwest in winter; the entire winter was almost a continuation of heavy gales.

Northeast gales showed different features, and, as it appears, these characteristics were very marked, if I distinguish two classes of northeast gale:

1. Such as were the primary impulse of a violent commotion of atmosphere, inducing a southwest gale at an adjacent place.

2. Such as were induced by a southwest gale in action at an adjacent place.

It is evident that in the arctic regions, where sea channels and streaks of land follow in regular order, polar currents will always select their paths, either on land or on sea, in accordance with the greatest tension of atmosphere, dependent upon the season; they will induce a southwest wind, which, on the contrary, selects its path wherever the air is the most rarefied; a mutual displacement takes place, and two gales blow in opposite directions at adjacent places. This frequently was actually observed at Thank God Harbor and vicinity.

Here are the characteristics of the two classes of northeast gales:

When a primary impulse, a northeast wind was always preceded by high atmospheric pressure, low temperature, and almost entire absence of moisture; veerings at the commencement and close of the gale were in accordance with the law of gyration. During the gale the barometer would fall, the thermometer would rise, and relative humidity increase.

When a secondary action, a northeast wind was preceded by low atmospheric pressure, high temperature, and low relative humidity; veerings before and after the gale took place contrary to the law of gyration. During the gale the barometer would rise slowly, temperature would almost remain stationary, and relative humidity would increase rapidly.

Southwest gales also had two different characteristics:

1. Preceded by low barometer, high temperature, and relative humidity; veerings before and after the gale, in accordance with the law of gyration; rise of barometer, fall of thermometer, and stationary relative humidity during the gale.

2. Preceded by low atmospheric pressure, high temperature, and low relative humidity; veering before and after the gale, contrary to the law of gyration; rise of barometer, fall of thermometer, and rapid rise of relative humidity during the gale.

Velocities above forty miles per hour were very frequent; light and pleasant winds were observed from all points of true bearing.

After my separation from the vessel, I frequently noticed the direction of the wind, which notations I append, in Paper II.

D.—Observations on clouds were made at times of systematic observations; formations, similar to those known in our climates, were noted; strata were prevalent, and the cirrus cloud was seen in the region of cumuli.

E.—*Observations on precipitations, &c.*

Precipitations in form of heavy snow or rain were rare, but very frequent in the form of fog, frost, smoke, haziness, and light snow. It frequently was observed during the summer that when moisture was precipitated over an area consisting partly of land and partly of ice, it would take the form of rain on land, but the form of snow on the ice.

F.—Observations on ozone were made daily; no ozone was obtained on our voyage north; more or less ozone was noted at winter-quarters, and some on our voyage south. At winter-quarters, and during the winter, the greatest amount of ozone was observed with northeast winds, but especially with heavy snow-drifts. During the summer ozone was very abundant, and decreasing in the fall.

G.—*Observations on solar and terrestrial radiation.*

Readings of the vacuum black-bulb thermometer and the free black-bulb thermometer were taken hourly in 1872, while the sun was above the horizon.

These thermometers, after a rigorous comparison with the standard, I placed in a horizontal position on crutches, about half a foot above the ground, where I spread a piece of canvas, thickly covered with cotton wadding.

Observations on terrestrial radiation were made hourly, at Thank God Harbor, with a naked bulb spirit-thermometer, which, after comparison with the standard, I placed in a horizontal position on crutches, its bulb immersed in cotton wadding.

A naked bulb spirit-thermometer was placed in a horizontal position, its bulb in the focus of a silvered concave mirror, and frequently observed.

The vacuum solar radiation thermometer at times showed above + 100°.

The terrestrial radiation thermometer at times showed close to — 70°. Conden tion of moisture on instruments placed out-doors in form of beautiful crystals, (a besques,) took place quite frequently.

H.—*Observations on crystallization of snow.*

All snow-crystals consisted of hexagonal prisms, either single or in numbers, arrang to forms similar to those observed by Scoresby and Belcher. When single they f quently were deformed, and quite frequently different forms were precipitated sim taneously.

I.—Observations on moisture with the psychrometer were made every three hours our voyage north; hourly, on our voyage south. At winter-quarters I took special c to operate in such a manner as to enable me to keep an hourly continuous series observations on relative humidity and dew-point. In order to judge such observati as to their accuracy, and to operate accordingly, it was necessary to once construc table exhibiting relative humidities and dew-points, at temperatures between 0° a — 50°. This I executed in the following manner:

1. I computed the elastic force of vapor of saturated air for every tenth of a degr by the exponential formula:

$$\log e = a - bA^x - cB^x$$

$$\log A = 1.9940493 \quad \square \ \square \quad \log b = 0.1397743$$

$$\log B = 1.9983438 \quad \square \ \square \quad \log c = 0.6924351$$

$$a = 6.2640348.$$

which formula represents best Regnault's entire experiments on the elastic force vapor of water.

2. The elastic force of vapor, corresponding to readings of the psychrometer, I co puted by—

$$x = f \frac{14.256\,(t - t')}{1240.2 - x\,t'}$$

3. Corresponding relative humidity found by—

$$r = \frac{f\,100}{F}$$

4. Corresponding dew-points found directly from results of (I.)

I then prepared a spirit-psychrometer by cutting off the lower part of the frame the two best Casella's spirit-thermometers, to bring their bulbs under perfect exposu to the air. A thin muslin was tied to one of the bulbs, and both thermometers w rigorously compared with the standard by which their relative correction, differen of indications, were accurately ascertained. During the entire winter hourly obser tions of the psychrometer were made, and the relative humidity and dew-point d duced therefrom in the manner shown by the following example:

Reading of standard — 20.3
Correction to naval standard — 0.4
True temperature of atmosphere — 20.7

A.
Reading of dry-bulb.
— 21.2

B.
Reading of wet-bulb.
— 21.3
Difference of A and B when dry — 0.3
— 21.6
— 21.2
Difference of dry and wet-bulb + 0.4
— 20.7
True temperature of wet-bulb — 21.1

Entering the table, previously constructed, with temperature of wet-bulb = — 21 and difference of dry and wet bulbs = 0.4, the corresponding relative humidity a dew-point would be found immediately. I frequently experimented with Regnaul dew-point instrument for the verification of psychrometer observations, having p viously ascertained the relative difference of the two thermometers of the instrument by rigorous comparison with the standard.

The following example will show how, from the indications of the instrument, I deduced the true dew-point:

Reading of standard.	—23.4	Reading of dry thermometer.	—25.2
Correc'n to naval stan'd	— 0.4	Temp. of atmosphere	—23.8
True temp. of air.	— 23.8	Correction of dry thermometer	+ 1.4

Reading of wet thermometer	—27.8
Difference of dry and wet bulbs, when both dry	— 0.7
	+ 1.4
True dew-point	—27.1

Simultaneous observations of psychrometer and dew-point instrument, when reduced in the described manner, resulted in values of the dew-point never differing by more than 0°.5.

The general features of atmospheric moisture at Thank God Harbor are very marked. In fall almost perfect saturation took place by the gradual precipitation of moisture accumulated in higher regions; in January almost entire dryness was observed, and in spring a rapid increase of relative humidity is on record. The fluctuation of moisture, in relation to certain winds and atmospheric pressure, I have already described.

K.—Experiments on atmospheric electricity were made during the winter, but without result. Both instruments used, a gold-leaf electroscope and an electrometer, constructed especially for the expedition, were very sensitive and were frequently hoisted on a pole to the height of from twenty to thirty feet, but without result. I afterward constructed a collection apparatus similar to the one first described by Romershausen, and permanently connected the same in the proper manner with the electroscope. This arrangement would enable the observer on watch to at once notice the presence of atmospheric electricity. I frequently tested this apparatus by applying an electrified glass cylinder, when the gold-leaf would immediately diverge. The collection apparatus was mounted on a pole, twenty-five feet high, and properly insulated; the electroscope had a ground connection by which it could be switched off.

L.—Auroral phenomena were of frequent occurrence in latitudes between 50° and 65° north, and very brilliant; rare in latitudes between 65° and 75° north, and frequent at winter-quarters, but faint, and only exhibiting white light. The general characteristics of aurora at Thank God Harbor were one or more continuous arches of perfectly white light and faint streamers, which were observed at almost all points of true bearing. These streamers at most times were observed directly opposite the true bearing of the sun, then below the horizon. Luminous appearance of the heavens in a similar relation to the sun was also very frequent, and, after a prolonged discussion of the scientific members of the expedition, classified as aurora. Only one complete aurora, forming three different coronas and of a rosy tint, is on the record of Thank God Harbor. This auroral display took place in the evening of some day of February, 1872, during the morning of which fluctuations of the needle, through about 12°, were observed; smaller disturbances were observed during the display. This aurora undoubtedly is identical with the great aurora of February 4, 1872, as it is the only red one seen by us. Not being in possession of an instrument, observations on the auroral spectrum could not be made. At times haziness and slow precipitation of very minute snow-crystals accompanied auroral displays. Experiments on the fluorescence of the aurora have not been made.

M.—*Observations on height of twilight arcs.*

Twilight arcs were observed even when the sun had its greatest south declination; the duration of twilight was always recorded. I also made several measurements with the sextant of the height of the twilight arc, but not as frequently as I would have wished to do, had the light and state of atmosphere been more favorable in rendering the arc sufficiently distinct for measurement. This measurement, when compared with the sun's declination, always showed an 18° distance of the twilight arc from the sun.

N.—*Optical phenomena.*

Mirages, halos, parhelia, and paraselene were of frequent occurrence; observations on the polarization of light of the sky could not be made for want of an instrument.

O.—*Observations on meteors.*

A great number of shooting-stars were observed, especially in November; several bright meteors are on record.

P.—*Miscellaneous observations.*

The line of perpetual snow must be placed above the height of 1,700 feet, as in Ju 1872, I found such an elevation entirely bare of snow.

Observations on evaporation were made, but had to be abandoned on account of c densation of atmospheric moisture and snow-drift.

Minute drops of mercury froze as readily as large masses.

After our arrival at Thank God Harbor I selected the times of observation, so t three of them were taken, respectively, at 7.35 a. m., 4.35 p. m., and 11.35 p. m., Wa ington mean time.

On our voyage north, all observations were made by Dr. Bessels and myself, relievi each other in eight-hour watches. From our arrival at Thank God Harbor until middle of January, I observed the instruments during sixteen hours and Dr. Bess during eight hours.

By the middle of January I considered Mr. Mauch, whom I had instructed in m ing observations, sufficiently advanced, and ever after Dr. Bessels, Mr. Mauch, and self took eight-hour watches.

The complete meteorological record, corrected and reduced by me, the book of co parisons, table of relative humidity, meteorological journal, &c., were among papers.

An incomplete copy of the meteorological record, uncorrected, is on board of Polaris.

6.—NATURAL HISTORY.

All notes and collections referring to this branch are in the hands of Dr. Bessels, w the exception of a botanical collection among my papers.

7.—GEOLOGY.

Notes and collections in reference to geology are also under charge of Dr. Bessels.

8.—NO OBSERVATIONS ON GLACIERS ARE ON RECORD.

Drift-wood, which has been collected on the southern shores of Polaris Bay and N man's Bay, and signs of Esquimaux, as the runner of a sled, and Esquimaux weap are among Dr. Bessels' collection.

The largest part of the instruments under my charge were lost at our separation fr the vessel; all books under my charge will be found on board of the Polaris, with exception of the Müller Pouillet.

PAPER 28.

WASHINGTON, D. C., *September* 30, 1873.

SIR: In accordance with instructions received from Colonel Mallery, I have endeav-red in the short time at my disposal to prepare a brief preliminary account of the evere cyclone that visited the shores of Nova Scotia and Newfoundland on the 24th nd 25th of August last, where it did immense damage; and have also given some ttention to the preliminary storm of August 13 and 14, which was severely felt on the hores of New Jersey.

In preparing the maps which accompany this report, an attempt has been made to ather in from all possible sources of information such meteorological observations s, although somewhat crude, may enable us to obtain a better understanding of he extent of these storms. To this end application has been made through Captain Iowgate for the logs of a number of vessels that have passed in or near the regions isited by the storms in question. A list of the sources of information will be found in he Appendix No. 1, and it is proper here to state that the office is especially indebted o the kindness of the Hon. Secretary of State; the Hon. Secretary of the Navy; Prof. oseph Henry, of the Smithsonian Institution; Mr. Lorin Blodget, of Philadelphia; the epresentatives at Washington of the New York Herald, Times, and Tribune, and the oston Advertiser and Journal; Dr. Smallwood, of Montreal; Professor Kingston, of oronto; the captains of the steamship Sonora, brig Dorothea, steamer E. M. Arndt; Ir. T. C. Hill, of Sidney, Cape Breton; W. Allison, of Chatham, Cape Breton; and Mr. I. Clift, of Harbor-Grace, N. F., for courtesies shown in the supplying of such material s was available for the purpose in hand. In Appendix No. 2 will be found a list of hose vessels whose logs were used in connection with the observations made upon hore.

Besides the meteorological features of the hurricane, the great destruction of life and roperty has rendered it proper that I should prepare a brief statement of such details s have been collected up to this date. In this work I have been especially assisted by ergeant Pearson, who has prepared a detailed map and the accompanying table, Appendix No. 3,) in which is shown the geographical distribution of the damage done o life and property. The sums-total given in this final table are evidently far within he probable truth, and I have thought it not improper to make the following slight dditions in order to arrive at a more correct idea of the ravages of this terrible storm:

One thousand and thirty-two vessels, of which four hundred and thirty-five were mall fishing-schooners, are known to have been destroyed during the 24th and 25th of ugust in the neighborhood of the Gulf of Saint Lawrence and the Atlantic shores of Iova Scotia, Cape Breton, and Newfoundland. On the other hand, over ninety vessels vere destroyed by this hurricane in the course of its passage over the ocean before eaching Nova Scotia, making a grand total of at least one thousand one hundred and wenty-three vessels destroyed within a few days by its power. Two hundred and twenty-hree lives are definitely reported as lost, and the most moderate estimate of the numerous

cases in which whole crews are stated to have been lost swells this number to nearly f
hundred, while if to this is added the loss of life on land, and the loss in the earlier h
tory of the cyclone, the grand total amounts to at least six hundred lives. The su
mary given shows that little less than nine hundred buildings were damaged or
stroyed during the 24th and 25th of the month. Any endeavor to estimate the va
of the property destroyed is attended with great difficulties, but may be within bou
if to the seven hundred thousand dollars damage done to wharves and crops is ad
one thousand dollars for each building, two thousand dollars for each of the lar
vessels, and one thousand dollars for each of the smaller vessels, which would giv
total of three and a half millions of dollars, a sum that it will be seen may easily
far below the truth. It is not unimportant to here remark that the ravages of t
storm have very seriously crippled the interests of the American and Canadian fi
eries, and that the loss falls with special severity upon Gloucester and other citie
New England.

The following maps accompanying this report give a general view of the progr
of this storm:

Map No. VII shows the meteorological conditions at 4.35 p. m., Washington ti
August 23.

Map No. VIII shows the meteorological conditions at 4.35 p. m., August 24.

Map No. IX shows the conditions at 11 p. m., August 24.

Map No. X shows the conditions at 7.35 a. m., August 25.

Map No. XI shows the conditions at 4.35 p. m., August 25.

On the latter chart the previous track of the storm, as far as it has been traced
also given; and in Appendix No. 12 is a table giving the geographical positions of
storm-center, showing it to have been one of a not very large class of cyclonic sto
that, beginning in the West Indies, work westward and northward, up between
Bermudas and the Atlantic coast, and then turn northeastward toward Newfoundla
It is scarcely to be doubted that such a storm as this must have continued its cou
for several days longer toward Europe; and it is an interesting fact that the Bulle
International of the Paris Observatory shows that a severe storm moved over
northern portion of Great Britain on the 31st of August, reaching Norway on the 2
September; and although no logs of vessels have yet been received from the east
half of the Atlantic Ocean sufficiently precise to establish the details of the connect
between this European storm and that of the preceding days in Nova Scotia, yet
interval of three and a half days is so short as to leave no reasonable doubt but t
they were identical.

It has frequently been stated that while no doubt could exist as to the identity
general of the great American and European storms, yet that no single instance of
kind had as yet been well established. It is to be hoped that the present contribut
to this subject may be considered as removing all doubt on this matter, although
pains will be spared to secure further testimony.

The principal features of the weather in the Middle and Eastern States during
period embracing the present study may be briefly summarized as follows:

On the morning of the 12th an area of slight barometric depression existed wes
the Alleghanies. The temperature throughout that region was of about the nor
value; the wind light and variable. The influence of this depression was, howe
already perceptible on the Middle Atlantic coast, where easterly winds with clouds a
light rain were reported, while over New England and Nova Scotia the barome
stood somewhat about the average value, with northerly winds and clear weather. V
sels off the coast reported northeasterly winds, and those over a hundred miles dist
designated these as gales. By the morning of the 13th the barometer had fallen
cidedly on the Middle Atlantic coast, and northeasterly winds increasing about to h
with rain prevailing throughout these States, while in New England the pressure h
slightly risen, it being apparently highest at that time over Maine and New Bru
wick. The indraft of air from the ocean continued during the 13th and until the 14
producing, as has been quite frequently noticed on other occasions, a continued incre
of the disturbance that had been initiated the previous day along the Atlantic coa
very heavy rains fell during the night, and a secondary barometric depression appe
on that morning to have been central over the peninsula lying between the Chesape
and Delaware Bays. It is, perhaps, impossible to say whether this depression origina
in Virginia or off the Atlantic coast, and whether it had moved northeastward or mer
northward.

This delicate point could have been settled, probably, had we been able to obt
any accurate meteorological reports from the peninsula in question; as it is, the
pression passing through Delaware on the nights of the 13th and 14th was apparen
accompanied by two, if not three or four, smaller storm-centers, which, being of
nature of tornadoes, seemed to have done considerable damage, both by wind a
rain, in Eastern Pennsylvania and in Maryland. The most severe winds were, a
always the case, reported from the New Jersey coast; and, destructive as these nor
easterly gales were to property on the land, it is satisfactory to be able to refer to

etter of Captain Felber, of the steamship E. M. Arndt, who testifies that, being on is way to New York with a disabled propelling-screw, and relying entirely upon the vinds, he was fortunate enough to obtain a copy of the New York Herald on the 10th f August, of the preceding day, containing the prediction of continued northeasterly vinds along the New England coast, and relying upon this, made a speedy and safe assage to the harbor of New York, which he entered at 6 p. m., August 13. The torm which on the morning of August 14 was probably central near Long Branch, New Jersey, appears to have increased somewhat in size and severity during the day, roducing brisk and high northeasterly winds in Southern New England, which inrease was, however, quite in accordance with our previous knowledge of the diurnal growth and subsidence of these phenomena. Owing to the presence of a large body f cold, dry air to the northward, the meteor could advance but very little in that lirection; it appears rather to have moved directly eastward, or possibly east-northeastward, and, on the morning of the 15th, to have been about one hundred miles outh of Cape Cod, while northeasterly winds, diminishing in force and backing to orth, prevailed, with clouds and light rain, in New England.

During the 15th easterly winds with rain prevailed at Halifax, and the disturbance eems to have almost completely died away. It is important to notice that, while this omparatively insignificant storm was thus passing northeastward over New Jersey oward Nova Scotia, the barometer had steadily risen at the Bermudas, with light vinds and pleasant weather on the 16th, but with somewhat stronger southwesterly vinds and rain on the 13th, 14th, and 15th. The highest pressure of the month was ttained at the Bermudas on the 18th of August, and rainless weather continued in hese islands from the 16th to the 21st of the month; indeed, the drought of August nd September has been much complained of by the residents of those islands. Durng the former interval the cyclone, which has been frequently termed the great Nova Scotia cyclone, was steadily developing some five hundred miles to the outhward. The first report that has reached us concerning this hurricane is robably that of the 13th of August, when the bark Crest of the Wave reported heavy gale veering from northeast to southeast in latitude 14° and longitude 7°; as, however, our next definite information concerning the hurricane is dated n the 18th of the month, it would be too much to assume more than that the veather experienced by the bark Crest of the Wave was intimately associated with he early history of the Nova Scotia cyclone. The observation, however, deserves o be recorded, inasmuch as several of these storms are already known to have originated not far from the region in which the Crest of the Wave then was, and it is ar from impossible but that we shall, by further diligent collocation of ships' reports, e able to carry back the history of the Nova Scotia cyclone from the 18th to the 13th f August, and possibly still further, and to show that this belongs to the class of cyclones that originate near the coast of Senegambia, and distinguished from those hat originate further to the west. Be this as it may, the history of the Nova Scotia cyclone since the 18th of August seems to be sufficiently clear. It was at noon of that late in about latitude 22° and longitude 60°, with light northeast winds and falling arometer at the Bermudas; at noon of August 19th it was in latitude 22°, longitude 3°; at noon of August 20th, in latitude 27°, longitude 66°; at noon of August 21st, n latitude 30°, longitude 67°.5, with falling barometer and strong northeasterly winds veering to southeast at the Bermudas; at noon, August 22d, it was in latitude 33°.5, nd longitude 68°.5; at noon of August 23d, in latitude 37° and longitude 67°, with outhwesterly gales at the Bermudas. At this time the barometric depression attendng the cyclone seems to have extended to a distance of at least five hundred miles orthwest and northward of its center, with falling barometer and cloudy weather reported in New England and Canada, while the report from Mount Washington hows continued northwesterly winds.

In the multiplicity of conflicting accounts concerning the positions of vessels and the veather experienced by them on the 23d, 24th, and 25th of the month, it is difficult to atisfy that desire for the exact truth which should guide the study of nature; and in tating, as my conclusion, that the center of the cyclone and its most terrific maniestation of power did not pass directly over Nova Scotia, but kept perhaps two hunlred miles off its coast, I am aware that discrepant observations may be adduced conflicting with this conclusion. It is my belief, however, that at midnight of the 24th–25th, the center of the storm must have been in latitude 44° and in longitude 56°. t was about this time that the lowest barometers were experienced at Halifax, Sidney, Charlotte Town, and also on board several vessels at that time near the coast of Nova Scotia. Between sunset and sunrise of this night occurred the greatest destruction of ife and property in this region, due to a terrific easterly wind, which within twenty-four hours backed from southeast to northwest. On the 25th at noon the storm was apparently central in latitude 44°.5 and longitude 54°.5. It was at this time that the owest barometer was reported on the Magdalen Islands, Gulf of St. Lawrence. It is to e remarked, however, that the lowest reading of the barometers in Nova Scotia and he Gulf of St. Lawrence when reduced to the sea-level do not fall below 28.90, while the occasional reports of barometric readings made by vessels at sea, incorrect thou they may be, owing to our ignorance of the errors of the instruments, yet uniform point to a pressure at least as low as 28.30 inches near the center of the cyclone. the 25th at midnight it is impossible to locate the region of lowest barometer near than is indicated by the winds at Harbor-Grace, Newfoundland, and Cape Bret which point to the center as being in latitude 46° and longitude 52°. At noon of t 26th the center must have been about latitude 47°.5 and longitude 50°. At this sa rate of progress the center would at noon of the 27th be in latitude 49°.5, longitu 54°.5. The accompanying table, Appendix No. XII, gives in addition to the precedi positions, which are comparatively well established, also the positions of the baromet depression that reached the shores of Great Britain a few days subsequently, as sho by the Bulletin International; this disturbance was apparently far less severe th that of Nova Scotia, which is in accordance with the well-recognized general rule th these storms gradually extend over a large circular area, and, after diminishing in for completely break up on encountering large continental masses of dry air.

In connection with this brief sketch of the progress of the Nova Scotia cyclone would respectfully direct your attention to the fact that whenever we have telegrap communication with the Bermudas it will become possible to greatly extend the sco of the storm-predictions, and by the co-operation of the fast-sailing European stea ers to forewarn vessels leaving the ports of the United States of the existence of a cyclone that may be in progress some distance off the coast. It is indeed evident th as any portion of the territory covered by the signal-service stations is liable to stor approaching from the southeast, southwest, or northwest, it should be equally pr tected, if possible, on all sides. The advantages of an extended correspondence wi navigators have been very strongly felt in the prosecution of this work, and a ve considerable extension in this direction of the work of the signal-service would see to be justifiable.

I have the honor to remain, very respectfully, yours,

CLEVELAND ABBE,
Assistant, Office Chief Signal-Officer.

Brig. Gen. A. J. MYER,
Chief Signal-Officer, United States Army.

APPENDIXES TO THE REPORT ON THE NOVA SCOTIA CYCLONE AUGUST 24-25, 1873.

Appendix No. II.

t of vessels from which information has been received concerning the Nova Scotia cyclone of August 24–25, 1873.

- America, steamship.
- Australia, steamship.
- Atlantic, bark.
- Arthur, brig.
- Assam Valley, ship.
- Albemarle, steamer.
- Athena, bark.
- Alexander, bark.
- Belle Stewart, bark.
- Brazos, bark.
- Crest of the Wave, bark.
- Dos Hermanos, schooner.
- Dundee, brig.
- E. M. Arndt, steamer.
- Excelsior, brigantine.
- Emma F. Lewis, schooner.
- Esperanza, ———.
- Ellen Southard, ship.
- Ella Maria, brig.
- Edinburgh, steamship.
- Everhard Delius, bark.
- E. M. Seeds, bark.
- Guldfaxe, ship.
- Hound, brig.
- Helen Sands, bark.
- H. M. Crosby, schooner.
- Helicon, ship.
- Hoogly, ship.
- Hebe, ship.
- Helvetia, ship.
- Hammonia, steamship.
- Importer, ship.
- Italia, steamship.
- J. Morton, brig or schooner.
- Jas. Kenway, bark.
- Kingston, brig.
- Louise, bark.
- La Plant, steamship.
- Lookout, schooner.
- Lapland, steamer.
- Mary Louise, fishing-schooner.
- Minnehaha, ship.
- Mary S. Lunt, schooner.
- Mercur, bark.
- Napier, schooner.
- Nora, ship.
- Orinoco, bark.
- Oceanic, steamship.
- Oak Point, brig.
- Pennsylvania, steamship.
- Primera, bark.
- Russia, steamer.
- Reform, bark.
- Ravenwood, brig.
- Saint Olaf, steamship.
- Saltwell, steamship.
- Sappho, schooner.
- Susan E. Voorhees, brig.
- Scindia, steamship.
- Spirito, bark.
- The Brothers, schooner.
- Thos. Dunham, ship.
- T. Arthur, brig.
- Tenax Proposite, bark.
- Young Eagle, bark.
- Zizine, bark.
- Zuleima, bark.

Appendix No. III.

tails of loss or damage incurred in storm of August 24–25, 1873, at Cape Breton, Gaspe, Labrador, Magdalen Islands, New Brunswick, Newfoundland, Nova Scotia, and Prince Edward Island.

Vessels described as fishing-schooners entered under the head of "small" vessels; all her under the head of "larger" vessels.

Lives lost: numbers only given where definite information has been received crews, where "all hands" are reported lost, have been estimated at 10 for eac crew.

Amount of property in dollars only contains such items as have been reported.

Buildings damaged or destroyed: contains all buildings, of whatever descriptio where numbers have been given.

All loss or damage described as "immense," "great," "several," "many," "incalculable," "unlimited," "very large," &c., has not been allowed for in total.

Names of places.	Vessels damaged, stranded, or wrecked.		Lives lost on land or at sea.	Amount of property reported in dollars.	Buildings damaged or destroyed.	Remarks.

22d.—Schooners Japan and Planet damaged by collision off Sheboygan. Planet put into Sheboygan for repairs.

Tug Black Ball cut off the stern of schooner Maria Martin, and damaged her to amount of $1,000 by collision in Detroit River.

Schooner Milwaukee Belle ashore on Chambers Island, Green Bay. Threw deck-load overboard and got off.

John Hunter, mate of schooner West Wind, drowned off Toronto.

Tug Witch of the West broke her shaft at Bay City.

Steam-barge Vanderbilt on bar mouth of the Thames River.

Schooner Laveland damaged chain-flutes, &c., in a jam on Saint Clair Flats.

23d.—Barge Oliver Cromwell and brig Orkney Lass sprung a leak while lading at Marquette, Lake Superior, and sunk beside the docks.

Alonzo Pearson killed by falling from mast of schooner F. Morell.

Steamer Eva English damaged on Saginaw River.

Schooner Express damaged on Lake Erie.

Schooner M. L. Collins ashore in Detroit River.

24th.—Schooners Westchester and Flying Mist damaged by collision at Chicago.

Schooner Mary Collins lost jib-boom and bowsprit by collision with propeller Arizona at Erie.

25th.—A small schooner sunk by striking dock at Chestnut-street bridge, Milwaukee. Raised and repaired.

Barge Saint Clair water-logged on Lake Huron.

Scow Planet sprung a leak at Milwaukee.

Schooner C. Harrison became water-logged at Evanston, and was towed to Chicago.

Propeller City of Fremont burst a flue on Lake Michigan. Detained seven or eight hours.

Schooner A. W. Lacky, ore-laden, broke her rudder on Saint Clair Flats.

Steam-barge Vienna and barge Verona ashore at Presque Isle, Lake Huron. Vienna got off without damage and Verona filled with water.

Steamer Young America ran ashore on Fighting Island.

Schooner S. P. Ely aground in Nebish Rapids.

26th.—Propeller Oneida struck on Belle Isle; aground fourteen hours and got off.

Schooner Marion Egan ashore at Cove Island, Georgian Bay. A total loss.

Schooner Gerritt Smith sprung a leak in the straits. Towed to Detroit by the tug Leviathan.

Schooner Maggie M. Rae water-logged on Lake Erie. Towed to Detroit River and there capsized.

27th.—Schooner Montana, ore-laden, grounded on Belle Isle, Detroit River.

28th.—Schooner Senator passed Detroit in a dismasted conditon.

Alexander Ross, mate of bark Tanner, was drowned at Buffalo.

Bark Acorn put into L'Anse, Lake Superior, in a leaking condition.

Schooner Comanche shifted cargo and arrived at Oswego with nearly 1,000 bushels wheat wet.

Eli Smith, sailor of barge Severn, drowned at Buffalo.

Steam-barge Mary Robertson arrived at Chicago in a leaking condition.

Propeller Waleska broke her wheel at Chicago.

31st.—Propeller Cleveland ashore at Middle Island, Lake Huron. Pulled off with slight damage.

Byron Robinson, of yacht Mazeppa, drowned at Coburg.

Barge Comet became water-logged on Lake Michigan. Towed to Chicago.

Schooner Cambridge struck and sunk while leaving L'Anse, Lake Superior.

PAPER 30.

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGNAL-OFFICER,
Washington, D. C., July 26, 1873.

SIR: I have the honor to report as follows: Having, in accordance with Special Orders No. 67, arrived at the scene of the tornado in Iowa, I there, to the best of my ability, endeavored to carry out the special instructions which I had received. The result is contained in the report herewith submitted.

Very respectfully, your obedient servant,

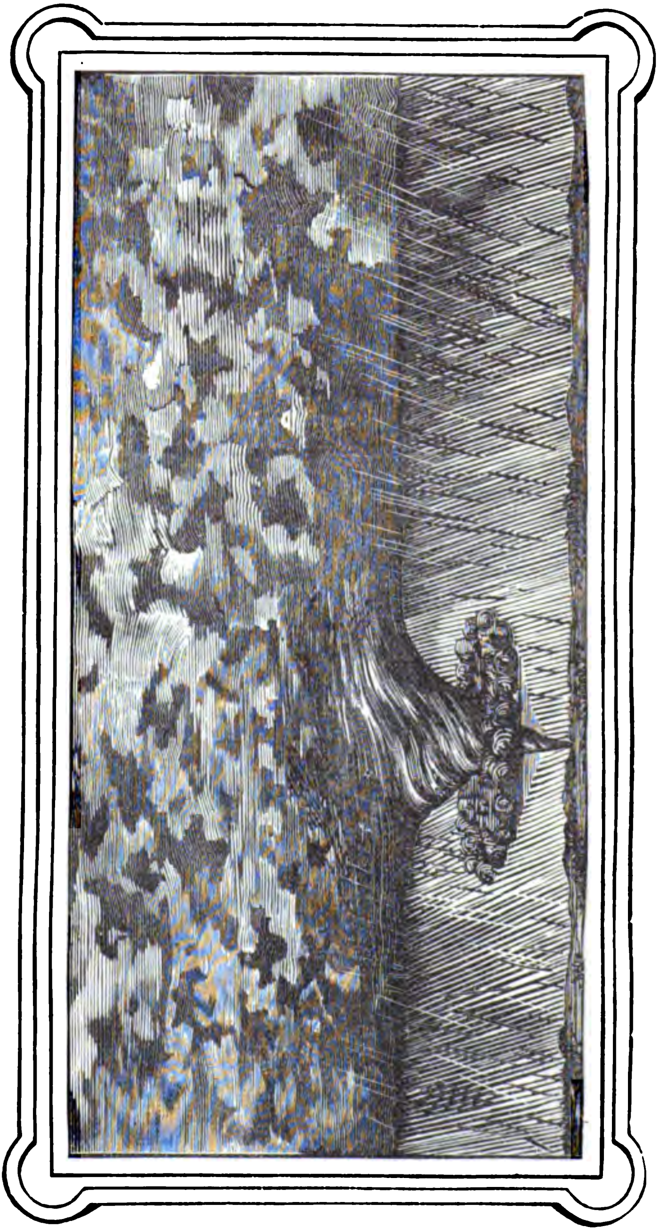
JAS. MACKINTOSH,
Observer-Sergeant Signal Service, U. S. A.

Gen. ALBERT J. MYER, *Chief Signal-Officer of the Army.*

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGNAL-OFFICER,
DIVISION OF TELEGRAMS AND REPORTS FOR THE BENEFIT OF COMMERCE,
Washington, D. C., May 26, 1873.

SERGEANT: Upon arriving at Washington, Iowa, in compliance with Special Order No. 67, O. C. S. O., of this date, you will at once proceed to the scene of the recent tornado near that place, and locating the point where it first struck the earth, will follow its path as far as its progress can be distinctly traced, giving particular attention to the following points suggested by the Chief Signal-Officer:

1. Trace accurately the course of the tornado, and determine whether its movement was direct, or whether it swerved at any time from a direct course, and, if so, the cause of such deflection.
2. Ascertain the velocity of wind in the whirl of the tornado; estimating this, when more accurate data cannot be had, from its effect upon inanimate objects, as for example, weight of objects moved, with area of surface of such objects exposed to the action of the wind.
3. Ascertain if objects were carried directly upward in the interior of the whirl without a whirling motion and thrown out at top, or whether they ascended in circles, whirling upward with the whirl of the tornado.
4. State if there are any evidences that the center of the tornado was a vacuum, as for examples: were trees wholly stripped of bark; did houses explode outward, &c.?
5. Ascertain if the tornado appeared to be attached at its upper extremity to masses of clouds, or to a single and small cloud.
6. Were there any electrical discharges accompanying the tornado?
7. Was the tornado seen, before its complete formation, as a tongue of cloud hanging down from a mass of clouds?
8. Did it any time cross a body of water; and, if so, did it assume at that point the character of a water-spout?
9. Did the tongue of cloud, reaching toward the earth, distinctly whirl itself, or was it stationary, with a whirling column of air rushing up its interior?
10. Collect reliable data as to the greatest height to which objects were elevated, and their weight.
11. Ascertain the condition of air outside the tornado, and whether the wind blew toward it from all directions.
12. Were there any premonitory signs of an approaching storm before the tornado struck the earth?
13. Where did the tornado originate, and where terminate?
14. Determine particularly whether the cloud from which the tongue of cloud depended had a rotary motion, or whether the tongue of cloud itself had one.
15. Duration of tornado, and progressive velocity.
16. Actual width of belt affected by the tornado.
17. Note the general direction of prostration of trees, being careful to allow for the change of direction caused by striking the earth.
18. You will prepare a series of questions to which answers will be obtained from the most intelligent citizens living in and along the track of the tornado, so that the same questions may be answered by different persons.



In addition to these points, you will investigate such others as will tend to give a onnected and full record of the origin, progress, and disappearance of the meteor.

Having completed your investigation of the Iowa tornado, you will proceed to the ocation of the one reported in Illinois as raging on the same date, and follow out the ame course of inquiry as for the Iowa storm.

Take ample time to do the work thoroughly, and report your location from time to ime by telegraph.

Very respectfully, &c.,

H. W. HOWGATE,
Second Lieut. and Bvt. Capt., Acting Signal Officer and Assistant.

Sergt. JAS. MACKINTOSH,
Observer Signal-Service, U. S. A., Washington, D. C.

THE IOWA AND ILLINOIS TORNADO OF MAY 22, 1873.

STATEMENT OF THE FACTS.

This tornado could not by its destructive efforts upon trees, buildings, &c., be traced arther back than section 35, Warren Township, Keokuk County, Iowa. At the point where the destruction commenced, the South Skunk River bends southward and then gain to the east, thus half inclosing a low level area of about one mile in length by alf a mile in breadth. This bottom-land is surrounded by bluffs about 70 feet in eight on nearly all sides, the river flowing close to the bluff on the southwest. It was at the northeast edge of this natural amphitheatre that the tornado first attained orce sufficient to demolish fences. These fences were thrown down by a southwest wind for a space forty rods wide. The buildings of W. W. Morrow, situated half way p the bluff, were partly destroyed. But although its first destructive efforts were here manifested, it by no means follows that this was the starting point of the tornado. On he other side of South Skunk River, directly opposite, there was a strong wind, accomanied with some hail and rain, while to the north and west a tremendous rain fell, receded and accompanied by large hail. The storm evidently arrived at Morrow's arm a well-nigh full-formed tornado. To trace it backward over a country where its henomena were only those of a violent thunder-storm, I found to be difficult and deemed unnecessary.

The attempt to prove a connection between this tornado and the thunder-storm near Des Moines of May 22, 4 a. m., has not been successful. For although the Des Moines torm exhibited tornado-like power, since the distance between Des Moines and Morow's farm is only seventy miles, and since the Des Moines storm occurred ten hours reviously, its rate of motion, if it is identical with the Keokuk County tornado, canot have exceeded seven miles per hour in a straight line. But, as will afterwards be hown, the tornado traveled more than twenty-nine miles per hour. This objection is y no means insuperable when viewed in the light cast upon the subject by the general modes of movement of storm-centers across the continent. These tornadoes, however, xist as something independent and automatic within the limits of areas of low baometer, and since their motion is governed by laws peculiar to themselves, it must meanwhile be accepted as valid. Besides, a hail-storm traversed Keokuk and Washngton counties May 22, at 6 or 7 a. m. There is much more probability of a connecion between this hail-storm and the Des Moines storm of 4 a. m. than between the atter and the tornado which occurred eight hours subsequently.

In the Neosho County Journal, of May 24, is an account of a highly destructive torado which desolated a portion of Lincoln county six miles long by one-half mile wide. This tornado was apparently every whit as violent as that in Iowa. The time at which t occurred is given as about 3 p. m. It cannot, therefore, be identical with the subject f this paper.

The conclusion follows that, wherever this tornado may have originated, it first ttained to desolating violence on Morrow's farm. Its previous history was only that f a thunder-storm, accompanied, perhaps, by an unusual tumult and whirling of the louds. In tracing its development and progress, therefore, I probably labor under no disadvantages which do not necessarily attach to the history of all such meteors exept those arising from the circumstance that the tornado was not at any point of ts progress witnessed by a skillful meteorologist.

Mr. Morrow testified that neither he nor any of his people noticed any funnel-shaped ppearance or tongue of cloud approaching the earth. There was a strong wind for a minute, but the destructive gust appeared to be instantaneous. A smart shower of hail ollowed the gust. A whirling of the clouds was observed several minutes before the wind. A little lightning was seen. The storm traveled east-northeast over Andrew

Surber's farm, blowing down fences, with a southwest wind. He saw the clouds whirling like a great wheel 35° in width before the storm, but did not notice any funnel appearance. A few hail fell with the wind, and a considerable shower of rain after it.

The same phenomena were repeated on J. E. Storer's farm. A steady roar was heard as it approached. No lightning seen.

About forty rods north of the line of destruction on these farms resides William P. Liske. He saw two clouds, one in the southwest and the other in the northwest, which appeared to rush together in the west. As the tornado came up, and about twenty minutes before it arrived, the wind changed to the north and blew so strongly that the door had to be held to prevent it from being blown in. Saw no lightning and heard but little thunder. Saw no funnel appearance.

Elleot Utterback was sixty rods south of the tornado at this place. He saw the clouds come whirling. The height of the whirling clouds was about 60° and the width about 30°. Saw lightning and heard thunder once or twice. Hail followed the wind in small quantity, and rain fell in considerable amount three-quarters of an hour later. During the day the direction of the wind was southerly.

John Malcum, section 30, Lancaster Township, testified: Was one mile south of tornado when it occurred. Heard a roaring like steady thunder in the west about a quarter of an hour before the storm came. Saw no lightning. A cloud covered the western, the northern and the northeastern portion of the sky. It extended somewhat beyond the zenith. The rest of the sky was clear. Saw a whirling mass of clouds. Could distinctly see them whirl contrary to the hands of a watch. The whirling mass appeared to be about 60° high when directly opposite. A smart shower fell some time after the tornado.

On Malcum's farm, the roof of a stable was blown to the southeast. This was the first damage done by a northwest wind. Two hundred yards south of the stable a fence was blown toward the northwest and north. This was the first evidence of a destructive southeast and south wind. The storm after becoming destructive had traveled one and a half miles before it developed force sufficient to commit destruction by a northwest and southeast wind.

T. Dawson, section 31, Lancaster Township: The tornado passed directly over the farm-buildings. He testified: Saw tornado approaching like two dark clouds with an intervening lighter-colored space between them. These two clouds together presented a funnel-shaped appearance; the upper end of the funnel entered the overhanging mass of cloud, which covered the half of the sky and extended to the southeast a little beyond the zenith. Its lower end did not touch the earth. It whirled contrary to the hands of a watch. Its elevation appeared to be about 60°, and its width at summit 40°. Heard some thunder previous to tornado. Did not see any lightning. After the tornado, there fell a few small hail and a little rain.

The breadth of fences thrown down on this farm was about sixty rods. The outhouses, &c., were damaged. A cultivator weighing about two hundred pounds was carried or dragged 30 feet. It presented to the wind a surface of not more than 3 square feet. If it was carried, the lifting force of the wind must have been between sixty and seventy pounds per square foot. The ground showed no signs of its having been dragged.

M. Williams, lawyer, section 32, Lancaster Township, testified: Time, probably 2.10 p. m; it was a few minutes after 2 p. m. Watched the storm as it approached for about one hour. A cloud rose in the west, which, stretching to the northwest, presented the appearance of heavy rain. Previous to the approach of this cloud, the sky was nearly clear. The wind during the day was southerly. About twenty-five minutes after the tornado the wind was again from the southwest. The storm-cloud did not extend far past the zenith to the south. Saw the funnel distinctly. It alternately lengthened and contracted, rose and fell. When it contracted, it appeared as if the narrow point next the earth was cut off, leaving the lower end broader. At times the upper end appeared to reach the overhanging clouds, and at times to be not so high. Its shape was something like It was of a dark-blue color when two hundred and fifty yards distant. When three hundred yards distant it subtended an angle of about 75°. The angle subtended by the top of it at that distance was about 55°. It had a zigzag motion. Half an hour previous to the tornado, there was incessant lightning in the northwest. Heard no thunder. There was no lightning in the tornado. A little rain and hail fell just before the tornado, and a smart rain-shower about twenty minutes after it. Have heard that to the northward there was a terrific storm of rain and hail accompanied with thunder and lightning. The wind was south generally during the day. As the tornado approached, the wind changed to a little east of south. Saw the dark funnel strike the ground on my farm. Saw it whirling contrary to the hands of a watch.

This witness was stationed about twenty-five yards south of the funnel when nearest to it. The fences were generally thrown toward the center on either side; but where the dark cloud touched they were carried away for a space sixty yards wide. We have e the first evidence of the dark cloud touching the earth in perfect funnel-form. But touch is yet only temporary; like a child learning to walk, its footsteps are yet certain. It proceeds with a wavy, zigzag, circular-pendulum motion. By and by its ad will make the earth tremble.

he storm traversed Jones's farm, throwing down fences, until it struck the Wolfden ool-house, which lay near its center. The school was in session when the tornado uck it.

ichard Weller, teacher, testified that this occurred at 2.15 p. m. precisely. This e is valuable, and I have adopted it as one of the data for calculating the velocity the storm. The school-house was moved with the children and teacher in it to the t, the north end 30 feet, the south end 20 feet. It was not overturned. The win- vs, roof, &c., were much damaged, but there were no evidences of explosive ces. The weight of the building was given by Mr. Williams as probably thirty ousand pounds. The surface exposed was 360 square feet, besides the slanting roof. slant of the roof was about 45°. The foundation was stone. It became very dark the tornado struck. After leaving the school-house, which is situated in a slight ine-like depression, the fury of the tornado abated somewhat. Hence, although it s nearly central over the hamlet of Hayesville, the frail houses were scarcely ched.

. U. Alford, who lives a quarter of a mile south of Hayesville, saw the tornado-cloud nging round in a circle like a flock of birds, and every now and again making a dip the ground and darting up again as high as the top of a tree. Its color was very k, inclining to green. The wind, which was south before the tornado, changed to th after it. A little hail fell as the tornado passed.

ohn Stephenson, Hayesville, a little south of the center, testified: Saw no lightning; rd no thunder; considerable rain about a half an hour after the wind.

. G. Konkricht, postmaster, Hayesville, testified: Tornado passed about 2 p. m.; rly perceived the clouds whirling contrary to the hands of a watch as the storm roached; saw lightning to northwest, and north of the tornado-cloud; heard no nder.

. W. Hayes, Hayesville, testified: Watched it for a half an hour previous to its ival; saw two clouds, one in the southwest, and one in the northwest, which rushed ether and appeared to create a whirl; saw the clouds whirling.

I. C. Dickey, who was at Hayesville, saw a cloud rush north, and then strike south h amazing rapidity; these were under-clouds; the whole northern heavens were ered with clouds; saw the funnel; it was of a dark green color and raised and ered itself at the bottom; saw no lightnings; heard no thunder.

. N. Bucher, one mile east of Hayesville, and about ten rods south of the tornado: v a funnel-shape, large at top, small at bottom, of a dark green color. It looked a kettle of soup boiling over. The funnel ended in a large cloud, which did not end much south of the zenith. The bottom of the funnel kept bulging up and vn. Wind was from the south previously. It changed to the northwest as it passed l it grew cooler. At this place only a few fences were thrown down.

V. H. Hawkins, Jordan farm, section 24, Lancaster Township, half a mile north of the rm, and not far from widow Jacob's house, which was destroyed. Testimony: There eared at first to be two storms coming up—one from the west and the other from northwest. A little rain and hail fell before the tornado, and rain in considerable ount after it.

he storm up to this point had been traveling east-northeast. Since leaving South nk River, it had been traversing a rolling prairie, with numerous sloughs, as they are led, but nothing like a water-course. A little to the east of the last witness it struck ublesome Creek, the banks of which are well wooded. No sooner did it do so than ncreased greatly in power, changed its path temporarily to due east, and developed phenomena of two or more funnels or branches of a funnel. Down in the hollow, ong the trees, stood the house of widow Jacobs. It was completely demolished, but thout signs of explosion. The storm-traces were already in great part obliterated, l a new house rebuilt. The path of destruction was two hundred yards wide at s point, and the general aspect of the fallen trees within this limit presented all the pearances of a complete cyclone revolving contrary to the hands of a watch, hough nothing particularly worthy of notice presented itself. About a quarter of nile from the main track to the south, a swath about fifty yards wide was cut ough the fences by a southwest wind. This swath appeared to curve toward the in storm-path, but it was not possible to follow it until it reached it, because of the rseness of the fences, and because there had everywhere on that side of the storm n a strong southwest wind, and this swath was merely exceptionally strong.

he storm-center next traversed the Grout farm, now occupied by Samuel Brunt, l passed about one hundred yards to the north of the village of Lancaster. Here operations became more interesting.

Samuel Brunt testified: Heard it roaring a long time before it arrived; as it ap- oached saw two funnels distinctly; their summits were lost in the overhanging

mass of dark cloud. Saw funnel on the south side, which was the smaller, sw
around in a half circle and join the larger one. The funnel had a pendulum moti
When it struck the ground it seemed to smoke, the smoke surging up like spray u
a wave-beaten rock. The wind felt cold as it passed. Saw lightning during torna
The breadth of the dark apex of the main tornado when it touched the ground
peared to be about 100 feet. There the wheat was mown as with a scythe.

The breadth of the path of the storm of sufficient power to throw down fences
here two hundred yards. The fences on the north side were blown south, those on
south side north, while along the center everything was carried east with the sto

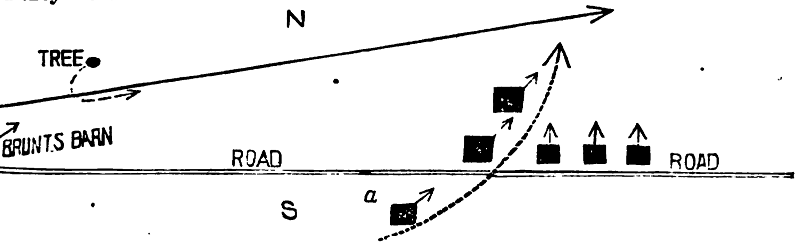
his completes the evidence for the village of Lancaster. It is somewhat discordant, ather, various. Some saw only one funnel; some two funnels, side by side; and rs two funnels superimposed, with the small ends together. The discrepancies are, ever, easily accounted for. As the cloud approached, it grew very dark. The tor- doubtless changed its form rapidly. The observers took a glimpse at it and ran ttend to their houses; or, as in the case of Follman, had to watch it under difficul- Those who saw two funnels appear to have seen through the center of what aped to those at a greater distance as only one funnel with the larger end down. evidence afforded by the ruins in the path of the storm gives no support whatever he belief that there were two distinct whirlwinds. The two dark clouds touching ground worked together in the strictest harmony in producing such effects as ld be produced by one tornado whirling contrary to the hands of a watch. But, as ady instanced, streaks of wind of unusual power curved in half circles toward the er at certain places. One of those streaks passed in a northeasterly direction ugh the town of Lancaster, while the main whirl was one hundred yards to the h of it. This streak was at first only a few yards broad, but rapidly increased in h as it proceeded. It first unroofed a frail stable, without injuring the house be- it. It then increased in force, throwing down four or five houses, and unroofing any more. The following shows the position of the houses and the directions in h they were blown:



e long arrow denotes the main track; the curved arrow the streak mentioned; short arrows show the direction of the destructive wind which threw down the ous buildings. Between the building *a* and the main storm-path there is a space fty yards comparatively uninjured. The sketch does not pretend to be strictly rate as to distances, but to give the relative positions of the houses.

aving Lancaster, the whirlwind traveled down the declivity toward North Skunk r in a direction somewhat east of northeast. It leveled the fences in its path, in way already described, and never varied from its commencement to its end. The e of widow Dogget, situated about a quarter of a mile south of the river, stands a to the northwest of the storm-center, at the commencement of the level bottom- s. Here two deep ravines, one from the south and one from the east, meet. In ravines the storm developed enormous power, smashing up the timber terribly. roofs of the house and barn were carried south and somewhat west. The trees on orth side of the center were thrown down toward the center, some pointing south- and south, but the majority southeast. On the south side of the center they lay ting northeast, north, and northwest. An oak-tree, 12 feet in circumference at the , was broken across 12 feet from the ground. At the bottom of the narrow, steep ne, running east and west, trees were lying just as they fell, some pointing east some west.

rs. Wimar testified: That difficulty was experienced in preventing the wind from ting in the door and windows; that it felt cool as the storm was passing; that a hail as large as hens' eggs fell before the hurricane, and a great deal of rain ward; and that the point of the lightning-rod upon the barn was partially ed by a flash of lightning.

e-quarter mile beyond Mrs. Dogget's house the tornado reached North Skunk r, which it then followed for over two miles in a southeasterly direction until it e to the southerly bend of the river, opposite Kohlhaus's saw-mill, when it sud- y turned to the northeast. The bottom-lands on both sides of the river are here red with tall timber, and through this timber the storm tore its way with resist- fury. All trees within a breadth of about one hundred yards were either over- ed or broken off and barked. The barking was evidently the result of three gs:

Many of the trees barked had been bent, so as to loosen the fibers of the wood. bending would infallibly loosen and perhaps break the bark.

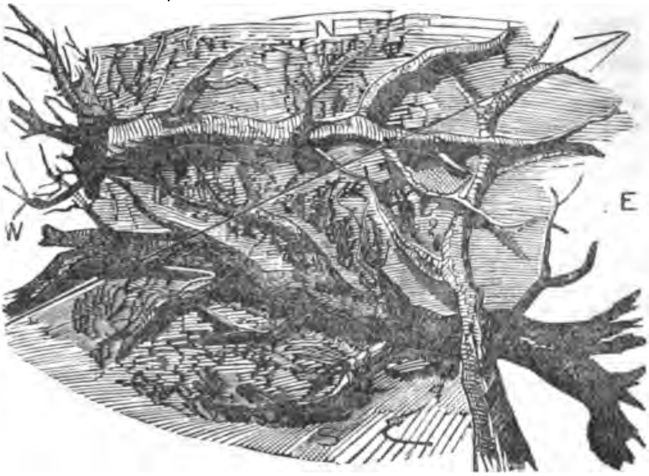
The air was thick with missiles, which not only broke the bark, but sometimes penetrated the wood. I have seen a corn-stump less than two inches in length sticki in the bark of a large tree which it had penetrated.

3. The peeling-off of such loosened and broken bark would be a light task for sucl tremendous blast. There was not the slightest evidence of electric action or of vap explosion.

Broken trees had the bark torn off, both up and down, from the point of breaka Trees half-broken and bent to the ground were similarly stripped.

At the place of rupture, the trees generally presented that broom appearance, which the supporters of the theory that electricity is the principal agent in t production of tornadoes have seen conclusive evidence of its truth. It will aft ward be shown, when this phenomena becomes more common than could be expect on the soft soil bordering North Skunk River, where trees were more easily uproot than broken, that this broom appearance is due to the excessive bending and straini of the fibers of the wood, and their rupture, in succession, from the exterior inward

The river, being impassable, rendered the examination of the general positi of the fallen trees more difficult. Everything, however, corroborated the e dence already so abundantly adduced, that the tornado was a whirlwind powerful centripetal tendency, circling contrary to the hands of a watch. The f lowing arrangement of fallen trees was selected as being typical. It was found on t north side of the river, near the center of the tornado.



No. 1 is a tree 3 feet in diameter, but much decayed, blown down from the ea southeast. No. 2 is a tree one-half foot in diameter, blown down from south-southea No. 3 is a tree 2 feet in diameter, blown down from the west. No. 3 lies above No. and No. 2 above No. 1. It occurred just where the storm left the river.

That the force of the storm was enormously increased immediately after reach North Skunk River is proved by the greatly extended width of its path. At A. D get's and B. C. Moore's houses, three-quarters of a mile distant from the storm-cent the out-buildings were damaged and the fences thrown down by a southerly wi Mr. Dogget testified that the tornado appeared somewhat like two funnels with smaller ends together, and that when apparently three and a half miles distant, column subtended an angle of about 25°. The houses of these gentlemen are situa on the summit of the bluffs facing the river, which are perhaps 200 feet high.

The house of Joseph Ash, situated on the face of the bluff, and distant from the ri about half a mile, was blown to the south-southwest. Large trees were at this tance blown down in the ravines running to the river. Mr. Ash testified that wind lasted a few minutes, and that it changed to the northwest after the passage the tornado. A little hail fell before the storm, and a small shower of rain after it. S lightning and heard thunder. It grew cool as the storm passed.

Matthias Gengler's house stands on the summit of the bluff, one mile distant fr the river. Due north of this farm was the saw-mill of Joseph Kohlhaus, where tornado turned to the northeast. Mr. Gengler testified that it presented the appe ance of a column rising from the river to the clouds. Its width at the top was tw as great as at the bottom. It was perfectly round and perpendicular. It moved ste ily along, without jumping up and down and from side to side. The angle of elevat

55° when opposite. The wind blew very strongly. Mrs. Gengler said that the om was the blackest, and that the top looked like clear, solid water. She could spin around and upward like a screw, contrary to the hands of a watch.

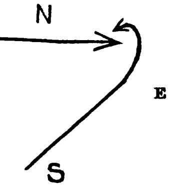
tthias Hotel's house is a quarter of a mile east of Gengler's, and at the same dis- e from the river. He testified that it appeared to him like a big tower. Some- s it was wider at the top than the bottom, and sometimes at the bottom than the All afternoon previous to the storm it was very dark in the north. As the tor- approached, the wind grew very high from the south, endangering the build- The height of the summit, when nearest, was 55° or 60°. Saw something prairie-chickens whirling in the air; believe now they were sheep. Do not know her any one has lost sheep.

e Black Hawk mills are situated about one and a half miles farther down the than the point where the tornado left it.

i Walker, proprietor, testified that he heard a roaring for perhaps an hour previ- o the arrival of the tornado. Saw it approaching apparently in a straight line itness. It seemed to move slowly, and was perfectly steady, without any oscillat- motion. Could not in the column itself recognize a whirling motion, but the clouds around the summit of it were whirling. The top of the column had an tion of about 30° when nearest. Saw it suddenly bend to the northeast at haus's. Before the tornado approached the northern sky was black with clouds, h extended eastward. The south was generally clear. A hail stone or two fell e tornado came up, and a light shower of rain afterward. Saw no lightning. d thunder previous to the tornado. While the whirlwind was on the river, the r ceased to flow over the dam, although the river at the time was high.

Stout was at Black Hawk mills. He testified: Saw it distinctly in funnel shape. d see it as far as Lancaster from the summit of the mill-buildings. The top of it ared, when one and a half mile distant, to be 15° in height. Saw two funnels together and form one. The smaller one came from the south and joined the oth- The top of the funnel looked like a solid body of water. Saw flashes of lightning top of funnel, apparently northward. The small end of the funnel was up, but was not much difference in size. The clouds above the funnel appeared to be ling and approaching the center. The funnel which came from the south was of hter color than the other. The wind changed as the tornado advanced, and blew gly toward it. The clouds above the narrow top of the funnel appeared to whirl nnel form, with the wide end upward.

e following represents the apparent direction of motion of the two funnels as they oached each other:



Henry Lundy was at Black Hawk mills. He testified that he saw it whirling contrary to the hands of a watch. Thought he could see the top of it, and that it did not reach the clouds.

Matthias Bevens was one mile southwest of the storm. He testified that the column resembled very black coal-smoke, and went right from the ground to the clouds. It whirled with great rapidity contrary to the hands of a watch, rising at the same time like the spirals of a revolving screw. The top of it was about three times the size of the base. Little dark clouds appeared to fly out and around the dark column. When one distant, it subtended an angle of 30°. Saw no lightning; heard no thunder.

e house and steam saw-mill of Joseph Kohlhaus stood directly in the path of the or, at the distance of a quarter of a mile from the river, on the north side.

. Kohlhaus testified as follows: The tornado appeared to stand still for several ents at the bend of the river, and then all at once bounded forward to the house. le standing still, it seemed to shoot or grasp out first on the one side and then on ther, as if discharges of artillery were taking place on these sides. The roaring terrific. It resembled the sounds of machinery magnified a million times. It was mbined woo-oo-oo and whirr-r-r-r. Watched the column as it approached. It was el-shaped, but changed its appearance. It twisted around and up like a screw. d not recognize bodies in the column; it was too black, and when the funnel e near it grew as dark as midnight. All the clouds were very low. They did not evolve. Saw lightning before the storm.

e building stood upon the summit of a rising ground, about thirty feet high. Be- n it and the river is a half pool, half marsh. It was completely emptied of wa- The breadth of the path of wholesale destruction was, upon the summit of the two hundred and seventy yards. The house stood one hundred yards from the rn and one hundred and seventy yards from the western extremity of this path. timbers and contents of this house were carried in a half-circle first to the north- , then to the west, then southwest, then south, and finally to the northeast, the ier articles being generally sifted out first, thus marking the way the ruins went. n the eastern edge of the path was an orchard, and on the western a wood. The s in the orchard were blown down from the southeast and south; the trees in the wood from the north and northwest. Portions of the clothing from the house shingles from the roof lay among the trees in the wood, or stuck among the branc There were no signs of explosion, the doors and windows having been blown in. inmates were all more or less injured. The width over which fences were blown d was here about three-quarters of a mile. An iron plow, weighing two hundred pou was carried forty yards. The sheet-iron chimney was carried two miles to the no east. An iron sausage-machine, six inches by eight, and weighing fifteen pounds, blown away. Part of it was found twelve hundred yards distant. The wheel wagons were smashed, and the tires twisted.

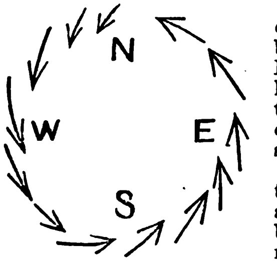
[The cut on page 1055 is a representation of the effects of the whirlwind at place.]

After leaving the mill, the storm ascended a hill some 200 feet in height, leveling fences, but with evidently diminished violence.

Peter Randolph, about two hundred yards distant from its northern edge, distin saw it whirling contrary to the hands of a watch. Lightning struck a tree on farm about half an hour before the tornado. This tree I saw myself. There wa light shower of rain after the tornado.

John Wehr said it looked like the cylinder of a threshing-machine, and spun aro like a screw.

Passing over the top of the hill in a northeast direction, it struck Rock Creek, w here runs south, with a little easting. Immediately altering its course, it went strai up the creek for about half a mile, developing prodigious power. The large trees wh lined the banks were torn and peeled and overthrown in promiscuous ruin. At a p where there is a small circular island, and a considerable amount of stagnant w around, the storm would appear to have stood still for a moment. The following sh the position of the fallen trees at this point:



There were no trees on the island itself. There wa evidence whatsoever that the barking of the trees been effected by electrical action or sudden evaporat Everything tended to prove that the bark had b loosened and broken by the excessive bending of trees and by flying missiles. One of the steers killed at creek had an oak rail driven completely through shoulders.

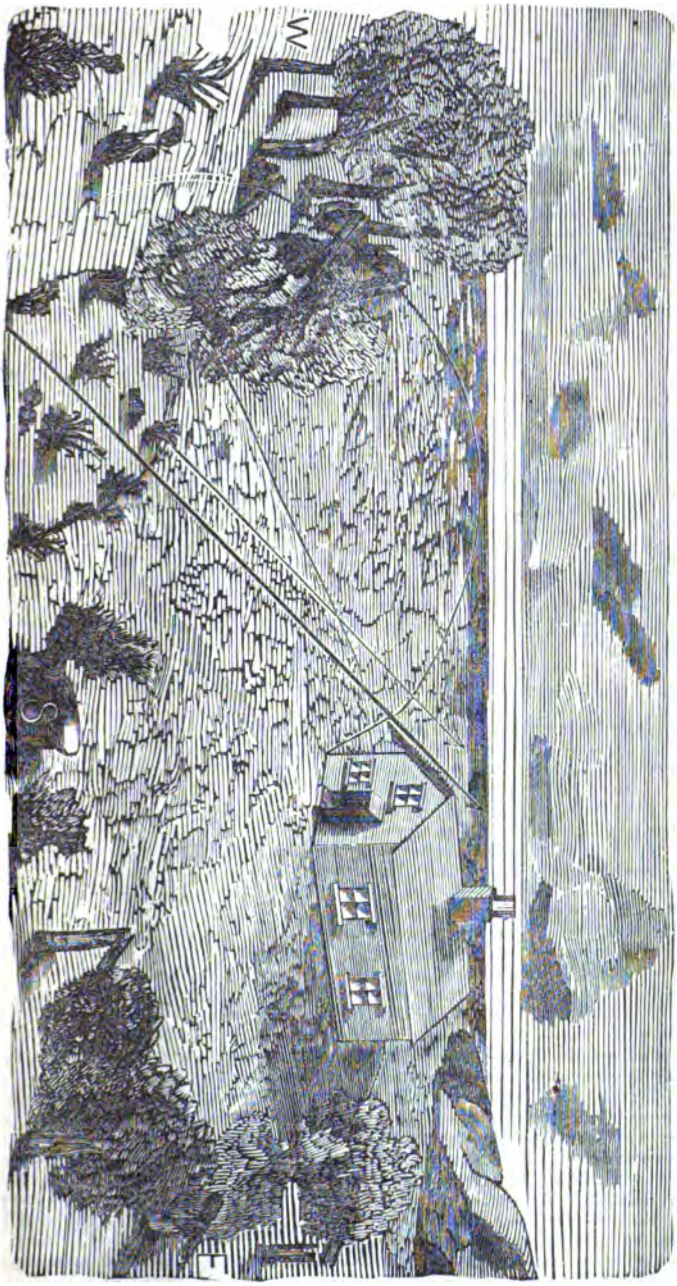
On reaching a slough which enters Rock Creek f the northeast the tornado followed it. Beside this slo and close to the creek was a small grove of young t belonging to John Stein. This grove was completely ried away, nothing remaining, except a few barkless tw At no point in its course did the storm develop greater energy than at this grove. G erally young saplings, over which the center of the storm passed, were, although strip of bark and twigs, left standing. Here the ground was whipped as bare as though grove had been lashed with a whirlwind of fire. The tornado then passed betw the houses of William Goeldern and John Stein, sweeping the fields, within the nar path of its greatest violence, clean of grass, wheat, and corn-stumps, while the gro was torn and furrowed by flying rails and trees. The rails and broken timber been gathered from the fields; but John Stein assured me that they lay thickest al the center of the storm. Along the sides of the path of greatest violence, many r were driven deeply into the soil, end foremost.

While the main whirlwind thus pursued the path described, there were smaller shoots or arms which played havoc on its southeast side. Such an arm cut a sw about twelve yards wide through Schild's orchard from southwest to northeast, swath widening as it went. It was not possible to trace it until it reached the m storm, for reasons similar to those already given. It seems probable, however, tha joined it at the little island above mentioned, where the storm appears to have m mentarily stood still. The relative positions favor such a surmise. This streak strong southwest wind was a quarter of a mile distant from the center of the m tornado.

A similar streak leveled the fences close to the house of John Stein for a width fifty yards, while nearer the main tornado the fences remained standing. This stre I surmise, joined the main storm at the grove above mentioned. A similar arm t down the new barn of F. A. Latz, about a quarter of a mile farther on, without in ing weaker buildings close beside it. The path of this streak is said to have been v distinct among the fences until it joined the whirlwind near the house of Peter Ma The fences were, however, already restored.

George Starr, three-quarters of a mile southeast of the tornado, witness: About 1 p it commenced to thunder and lightning in the northwest. The storm advanced al the northern sky, and it lightened terribly there previously to the arrival of the nado. A big cloud extended from southwest to northeast. It cleared up immediat the tornado, both here and in the north. Lost eighteen head of cattle at Rock k. One was perforated by a rail.

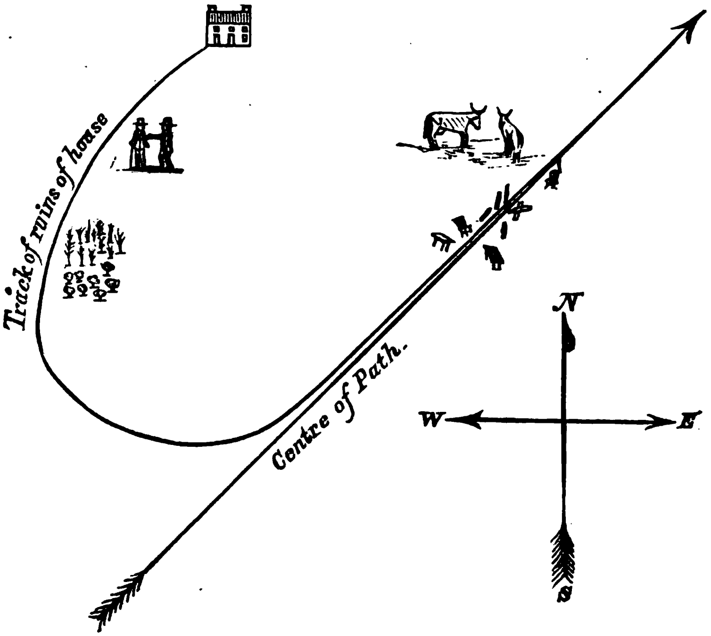
hn Marsh's house stood a little to the northwest of the center of the storm. His



Effects of the whirlwind at the house of Joseph Kohlhaus.

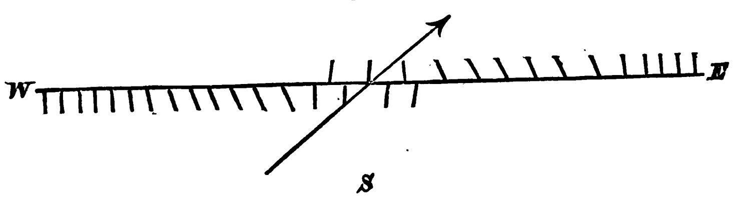
imony: Watched it as it came directly toward me. It deflected a little from side ide, with a zigzag motion. It turned and twisted like a screw in revolution. All family were in the house, the house having no cellar. It became as dark as midnight. The windows and doors were blown in, in spite of our resistance, and we knew no more until we found ourselves lying in the slough severely wounded.

The destruction at this house was most complete. The house was carried forwar from its foundations bodily; but as it was going down a declivity toward a slough, i failed to strike the ground until it went to pieces. The heaviest timbers and the inhabitants were deposited in a slough, about one hundred yards south-southwest o where the house stood. One child was killed instantly, and Mrs. Marsh has since died The fragments of the house were carried, as was easy to trace, first to the southwest then in a curve to the south, the southeast, the east, and then along the center of th storm to the northeast, the heavier articles sifting out as they went. I found ears o corn two hundred yards to the southwest and south of the house, and a fragment o heavy wood four hundred yards to south-southwest. Two cows and thirteen hogs were in a yard a little nearer the center of the storm than the house. They were carrie one hundred yards to the southeast, and killed or fatally injured. A stone from th foundations of the house, weighing about one hundred pounds, was said to have bee carried about one hundred yards south; but I could not find it. Sewing-machine, cultivators, wagons, &c., were wholly carried away, and left not a wreck behind. Th timber was generally reduced to the dimensions of fine fire-wood, and thickly strew along the path of the storm to the northeast. The width over which fences wer thrown down was here about a half a mile.



Sketch of the path of the ruins of Marsh's house.

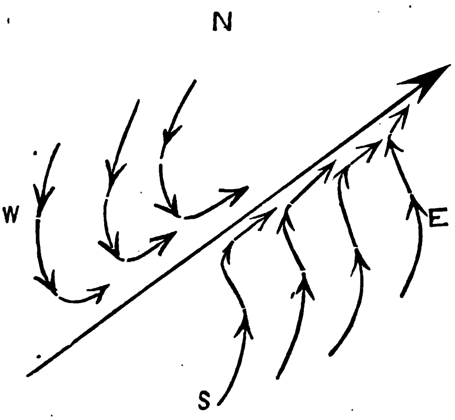
A quarter of a mile to the north of Marsh's house stood the house, barn, &c., of M Fuh. They were blown to the southwest, but without being carried away. The nex house struck was that of M. E. Harris, the storm-center passing about twenty yards t the northwest of it. The fiercest of the storm was here only one hundred yards wide but fences were blown down for over five hundred yards. The doors and windows o the house were driven in by the wind and the flying missiles, and immediately th house went to pieces. The house and out-houses were carried away, broken to smal pieces, and deposited for a mile or two along the path of the storm. The trees aroun the house, which were not plucked out by the roots, had their tops and branche broken off and their bark stripped from them. The stripping of the bark was evidently due to the causes already assigned. The stripping was most complete on th southwest side of the trees. A fence four hundred yards in length, and running eas and west, was deprived of its boards, the posts still remaining in the ground. Wher the storm-center crossed it, the direction toward which the posts were leaning wa eterminate. On the west of the center the posts were leaning south, with a little ting, and on the east of the storm-center they were leaning north, with a little ting.



he above is something like the disposition of the posts along the line of the fence. length of fence thrown down east of the center was about one-quarter greater u that thrown down on the west of it.

he corn-stalks in a contiguous corn- l were thus disposed: Those on the theast side of the center curved und from pointing nearly due north nearly due west. Those on the thwest side curved around from nting nearly due south to nearly east. Along the center all pointed h the storm. This shows the direc- n of the last wind, strong enough lter the position of the stalks.

latthias Linen, a quarter of a mile thwest of the edge of the storm, tified that it presented the appear- e of a great column, reaching from ground to the clouds, and whirling trary to the sun. It seemed to re- in almost still at some places, and n would dart forward. Hail four hes in diameter fell as the storm sed. They were very irregular in m.



Corn-field.

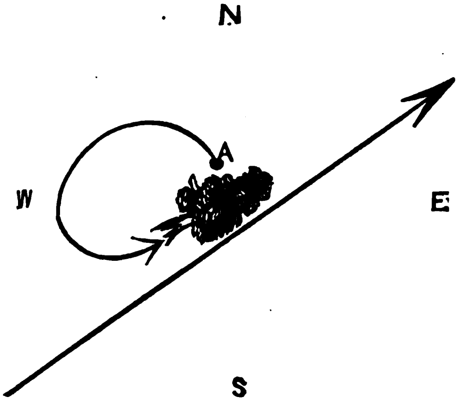
aul Ritter, Clear Creek Township, section 9, testified that the tornado looked like ig tree, only it was five times greater at the top than the bottom. It turned like a eel in a mill. Its direction of evolution was against the hands of a watch. At the tance of a mile, its top, when it entered the cloud, made an angle of about 60°. Hail large as pigeon's eggs fell before the storm, and it rained very hard after it. Saw tning in the west previously.

Ir. Ritter's house stands about seventy yards to the northwest of the storm-center. path is here about two hundred yards wide. The arrangement of stalks in a corn- d was the same as that already given. The roof of the house was carried south. A mp-cutter, which was standing by the house, was carried—the iron portion fifty ds south, the wooden portion half a mile to east-southeast. Wheels which came hin the reach of the storm were dashed to pieces, and the tires twisted into all sorts shapes. An oak tree, 3 inches in diameter, and which stood exactly in the storm- ter, was split by a fragment of a board one inch thick. The board was originally bably 6 inches broad and 8 feet long. Of the two small fragments remaining in the e, the longer was only 17 inches in length. The board was driven into the tree m the southwest. The path of extreme violence, about fifty yards wide, was ongly marked in the grove of young oaks. They looked as if they had first been hed against a pile of stones and then trailed in the mud. Portions of bark were ıck off and the smaller branches shattered and peeled. This grove stands upon the ge of a steep declivity about 100 feet in height, at the bottom of which flows Clear eek. Here is a circular hollow nearly enclosed by high bluffs, and within it the rm raged with demoniac fury, smashing trees of 4 feet in diameter to pieces.

he following instance was found on the opposite declivity, up which the storm ed with undiminished power:

he tree stood at A originally. Its root was partly decayed, and it must have fallen th the first strong gust. The path which it traveled was cut out in the grass by root. This path was forty-seven yards in length and was nearly circular. It first ved to the northwest and then round in a curve, until it lay pointing to the rtheast, with its top almost touching the spot where its root had formerly been. e tree stood to the northwest of the storm-center, and was two feet in diameter.

Crossing the summit of the rising ground, which was thoroughly plowed up, the storm traversed a wooded ravine, where for a width of fifty yards it deprived the young trees of their twigs and of much of their bark, besides throwing down the full-grown.



Nick. Engledinger, section 10, Clear Creek Township. His house stood about one hundred yards from the southeast edge of the tornado. From any indications which the remains presented, the timbers must have first been carried north. Two persons were killed—one of them being torn to pieces. A hog weighing four hundred pounds was carried one mile and a quarter in the line of the storm.

The house of Jacob Koerth stood fifty yards within the northwest edge of the storm. The timbers went south. The people tried to prevent the wind from blowing in the doors and windows, and could not. The wind entered and blew the house asunder leaving the floor in its proper position. Hogs weighing three hundred pounds were carried to the northeast across a ravine and deposited three hundred yards away. A horse, a cow, and a bull were similarly carried two hundred yards. Sheep were carried four hundred yards. In addition to the accidents inseparable from such an aerial voyage, the bodies of the animals were driven full of pieces of wood. On this account, the bodies of all animals which perished in the storm were burned.

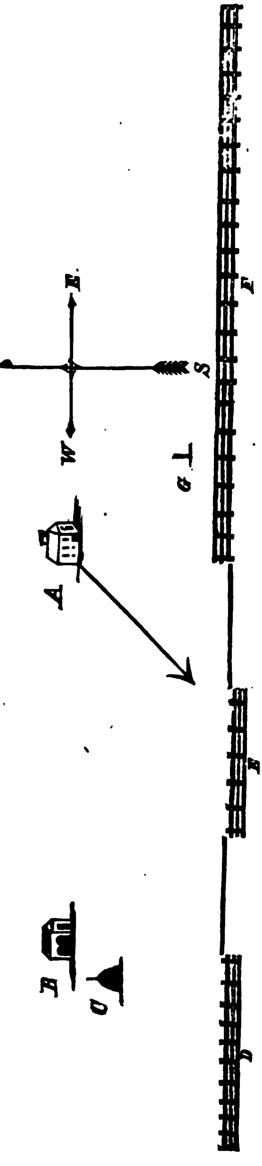
A horse-power machine, partly wood, but chiefly iron, and weighing two thousand four hundred pounds, was pushed or carried six yards. It was resting on the ground, and was separate from all other objects. There were no marks upon it arising from violent collision with other bodies. It exposed a surface of about two square feet to the wind. It lay close to the ground. The master of this house was absent, and information, owing to the invalid condition of the inmates, was hard to obtain.

The storm now turned somewhat more to the northward, traversed several fields, demolishing the fences, until it struck the house of R. F. Campbell, Lafayette Township, on the borders of Clear Creek Township. The exact position of this and the two immediately preceding houses was difficult to determine upon the map, because of its very defective condition, and because their owners could not tell me what section they were in.

Mr. Campbell testified: That previous to the tornado he observed several currents above one another among the clouds. The wind was from the southeast. The lowest current of clouds from the southwest, the next from the northwest, and the highest from the northeast. It commenced hailing about fifteen minutes before the storm. The hail was, in some instances, three inches in diameter, and fell in considerable antity. It was calm when the hail fell. The hail was very cold. When two were t together they immediately froze. The north was full of black clouds previous to tornado, in which the lightning flashed incessantly. Heard a dull, thundering se in the northwest previous to the tornado as of falling hail. There appeared to rain or hail falling on both sides of the vortex as it approached.

The preceding cut shows the appearance it presented at the distance of seventy yards. ere appears to be two incipient funnels, one on each side:

post 8 feet in length and 4 inches in diameter, and driven into the soil 3½ feet, was led out by the wind. It stood without attachment.



The width of the storm here is one hundred and sixty yards. The house stood within twenty yards of the northwest edge. It was tilted up on its corner bodily, inmates, floor and all, and deposited on its roof seventeen yards to the southwest of its former position, and then went to pieces. There was no indication of explosion. The accompanying is a plan of the effects of the storm at this house:

A is the house, which was carried in the direction of the arrow. B is a stable and C a haystack, both untouched. These were twenty yards from the house. D, E, and F are portions of a fence which were thrown down. D and E were thrown south, leaving the intervening portions untouched. F was thrown north. G is the post already mentioned.

This was the last destruction in Keokuk County. The tornado ceased to touch the earth on Mr. Campbell's farm. It drew itself up into the cloud from which it had come down. Hitherto it had traversed a country full of deep and well-wooded ravines. Here it entered upon a flat, bare country, in fact a watershed. It continues much the same for the seven miles which the tornado here skipped.

J. Yeats Brockway's farm, Lafayette Township, witness: Saw whirling in the clouds, after the tornado lifted, contrary to the hands of a watch. Watched it for ten minutes at least afterward, and it continued to whirl. The whirling portion of the clouds did not appear to be wide.

Mrs. Fobes, who resides about one mile northwest of the line of the tornado, witness: Saw the funnel. It seemed to stand still. Then it took a bend to the east. Then it grew so dark she could not see it. It grew lighter, and she could see it distinctly to the northeast of Campbell's house. It vanished suddenly, and she saw it whirling at a furious rate in the clouds contrary to the hands of a watch. Did not notice any more roaring after the tornado lifted.

H. Case: Resides about one and a half miles from the line of tornado had it continued. It rumbled a long time before the tornado. The sky was clear in the southeast. Saw no lightning. Hail of large size fell before the tornado approached. The center of the hail was shaped like a bird's egg, and pieces of transparent ice—like rock-candy—were stuck all around it. There was scarcely any rain afterward. The wind was blowing from the southwest at first and changed to the east as the storm came near.

Katie McLoud, school-teacher, witness: The school is a little to the northwest of the line of the tornado had it continued. It must have been about 3 p. m. when the tornado was here. Distinctly saw the funnel whirling contrary to the hands of a watch. Watched it until I could not see it for heavy rain. It had hailed about half an hour previously. The wind, while it rained, came from the northeast, blowing nearly straight toward the storm.

. H. Simpkins, Keota, witness: Thinks the sound continued after the tornado d, but not so loud.

oseph Charlton, Keota, witness: Saw the funnel distinctly reaching from the earth he clouds. The clouds were very low. Saw the tornado disappear. It had only to rise a little way when nothing, except the low cloud, was visible. The dense low clouds continued the same and the funnel only disappeared. The southern sky was clear.

J. R. Turner, Keota, witness: There was a very heavy rain, mixed with enormous hail. One hailstone was 7¾ inches in circumference, after lying some time.

T. D. Melville, Keota, witness: It commenced to hail about twenty minutes before the tornado disappeared. Further to the north it commenced sooner. The low cloud allowed only a small portion of the tornado to be seen. At three miles distance the funnel only subtended an angle of 15°. The rain came about twenty minutes after the hail. Weighed a hailstone of four and a half ounces, measuring 3 inches in diameter. It lightened a little.

T. N. Smock, Keota, witness: It hailed before the tornado disappeared. Saw some lightning in the direction of the tornado. The direction of the wind, while the hail was falling, was from the northeast; but it was light. There was not much wind with the rain afterward.

G. W. Erwin, Keota, witness: Remembers that when the tornado lifted the sound ceased.

W. R. Charlton, Keota, witness: Did not not notice the noise after the tornado lifted. Heard it long and loudly before.

Robert Renfrew, Keota, witness: The town was all scattered with oak-leaves as the tornado passed. The wind previously was southwest. It changed to east as the tornado approached, and during the east wind the oak-leaves fell. After the oak-leaves fell, the sound suddenly diminished. Saw an elm fence-board 8 feet by 6 inches by 1 inch, and weighing from fifteen to twenty pounds, taken out of the ground. It was driven about 4 feet into the soil at an angle of about 45°.

Dr. D. McFarlane, Keota, witness: Was five miles on the southeast side of the line of the tornado had it continued. Heard in the west a roaring for perhaps twenty minutes previous to and after seeing a smoky appearance.

J. F. Wilson, postmaster, Keota, witness: About 3 p. m. was making up the mail. The storm was then coming up.

The storm having ceased to act as a tornado upon the surface of the earth, I proceeded to Westchester, Washington County, where it was reported to have struck. There can be no doubt, however, that a strong, though not a destructive wind, was felt over the intervening space, and that it obeyed the usual law of cyclones by blowing in spirals toward the point over which clouds continued to whirl like a great wheel.

G. W. James, station agent, Westchester, witness: Saw the main cloud whirling rapidly contrary to the hands of a watch. Saw an arm come down and strike the plowed field. Could hear roaring overhead. The roaring was louder before the storm arrived then when it was here. A few large hail fell and a little rain.

J. T. Robertson, Westchester, witness: The arm which came down carried up considerable quantities of mud and cornstalks. A few fences were blown down and a small wooden building damaged. There were only a few gusts. The revolving cloud was only a little way above the tops of the houses.

Mrs. Thomas Gavin, Westchester, witness: The wind blew down the blacksmith's shop in the rear of our house. The house itself was shaking. Hail fell as large as hens' eggs. It grew quite dark when the house was struck. Everything was blown toward the northeast.

S. W. Wilson Cedar Township, three-quarters of a mile northwest of Calvin Craven's farm: Heard roaring for more than an hour previous to the advent of the tornado. Watched the cloud as it came along. Saw the tree-tops whirled by it. It appeared to be only 10 feet above the tree-tops. Hail as large as pigeons' eggs fell previous to the tornado, and a great quantity of rain after it.

T. B. Coffman, Cedar Township, section 33: (The tornado passed about a quarter of a mile southeast from witness.) Heard roaring like a heavy train of cars. Saw a whirling cloud in shape of a funnel. Hail not so large as hens' eggs fell immediately after the tornado passed. The top of the funnel was about 40° high when it was nearest.

Rev. J. P. Coffman, Cedar Township, section 33, witness: The tornado arrived about 3 p. m. Heard the noise for more than one hour previously. When it was hailing heard the sound just as distinct as before. Did not hear roaring after the storm passed. The wind before the storm was nearly due south. After the storm, and with the rain, the wind came from the north and northwest. Have learned that two or three miles to the north the rain was tremendous. There was lightning in the northwest previous to the tornado. As it approached, saw light, fog-like clouds, rushing, with the greatest rapidity, from the north. Its form was not so distinct before as after it passed, when it presented a decided funnel appearance. It was nearly clear in the south. When the funnel was distant about one mile it appeared to subtend an angle of about 25°. The funnel might have entered the dark, overhanging clouds, but it appeared to be wholly in view. There seemed at one time as if iere had been a violent explosion in the revolving mass, as it was somewhat broken o. Hail larger than pigeons' eggs fell with the south wind before the storm.

The tornado passed over Mr. Coffman's house, blowing down fences about a quarter 'a mile in width, and damaging buildings. It was all done by a southwest wind.

Calvin Craven, Cedar Township, section 33, witness: Previous to the storm the wind ew briskly toward it from the east. The cloud, as it approached, extended from uthwest to northeast, covering the whole northern sky. Heard the roaring of the rnado, like several trains in motion, about thirty minutes previous. Saw white, ggy clouds darting through one another with frightful velocity as it came near. bove these whirling clouds was a dense black cloud. A few hail fell before the tor- ado, and a little rain after. Have heard that a most tremendous rain fell about one ile and a half to the north. It was extremely warm before the storm.

J. C. Brown, Jackson Township, witness: Was on the northeast of Calvin Craven's. oticed the tornado first as it was tearing his fences, &c. At this time there was one hirl which reached the earth. It was not a jet black, but the color of coal-smoke. here was a big cloud directly over, but, although in commotion, it did not whirl. Vent into a ditch to escape the hurricane. I then saw other two funnels, one on the uth side and the other on the north side of the main one. All three moved forward ward me; but the outside ones also moved toward the central one. In a short time ey joined the central one, which then appeared to stand still, and whirl around and ound for a moment. The side ones did not whirl. They were bent forward at their wer ends where they touched the ground. The middle one did not whirl. It moved ue east, and then northeast, and then due east again. The tops of all these were sev- ral times wider than the lower portions. Saw no lightning. A little hail fell before ud a little rain after. The wind blew from the southeast before and from the north- orthwest after the tornado.

William Scranton, Cedar Township, section 27: Scranton's house stands on the north- ast edge of the storm. The roof of the barn was carried 150 feet due east. A tree in e orchard was blown toward east-northeast. The center of the storm passed over the enter of the farm. The fences on both sides of it were thrown down toward it. The vidth of the path here is half a mile. The storm appeared to Mr. Scranton like two louds coming together, one from the southwest and the other from the northwest.

R. H. Craven, Cedar Township, section 27, witness: A little hail fell before the tor- ado, and a little rain after it. The wind was northwest when the rain was falling. t cleared up about half an hour after the rain. In two places on the road east of cranton's house ten to fifteen rods of fence were blown down, leaving the interven- ng fence standing. The fences on this farm were blown as usual.

W. H. Burham, Cedar Township, witness: Was on the edge of Scranton's farm. leard the storm a long time before it came. Saw it about twenty minutes. The wind efore the storm came from the south quite strong. Then it grew calm. Then there ame a very hard wind right from the north. An intensely black cloud, apparently bout 4 feet wide at the bottom, and swelling out like a large haystack, passed three undred yards to the south. The top of it, when it entered the clouds, appeared to be bout 45° high. It moved up and down, now striking the ground, and now passing ver it. When it struck the ground it tore up everything. Saw it whirling contrary o the sun. Hail as large as walnuts fell before the storm, and a hard rain-shower fter it, and then it cleared up immediately. Heard there was a heavy rain two miles o the north, washing away culverts and bridges. It felt cool as the storm passed, but rew very warm afterward. Saw rails flying out from the summit. An average rail eighs about forty pounds.

Frank Brown, Cedar Township, section 26, witness: Distinctly saw the funnel revolv- ng contrary to the hands of a watch. Its height at one and a half miles distance was bout 15°. Its top was five times broader than the lower end. Saw it strike the round after it passed. Dark clouds appeared to strike the ground and rebound like pray. Saw only one funnel. The cloud extended from southwest to northeast, cover- ng the whole northern sky. Observed sheet-lightning in the tornado several times. t grew slightly cold as the storm passed. When the tornado had passed about one nd a half miles it appeared to stand still, and a strong gale, with rain, blew directly rom it, so that I thought the storm was coming back. Almost everything on the farm which was blown down was blown toward the northeast. The breadth of path is a quarter of a mile.

Mr. Brown's house stands on the southeast edge of the storm.

J. S. Philips, Cedar Township, section 26, witness: Was holding the window looking west to prevent it from being blown in, and noticed that it was 3.15 p. m. Hail fell, between a tea-cup and a hen's egg in size.

Mr. Philips's house is one-half of a mile southeast of the storm-center.

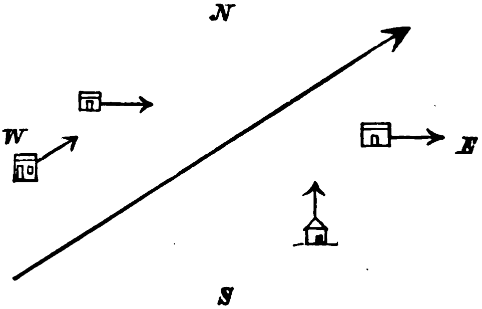
W. W. Cook, Cedar Township, section 25, witness: (House four hundred yards south- east of the edge of the storm-path.) About twenty minutes before the storm came up the wind blew briskly from the south. When the tornado was passing it blew a strong gale from the southwest. It rained after the tornado, and during the rain the wi blew from the west.

The son of this witness was two miles to the southeast during the storm. Hail large as pigeons' eggs fell there and a little rain.

J. W. Plumber, Cedar Township, section 26: (House on southeast edge of the stor When the tornado was several miles off saw a mass of clouds come from the northw and another from the southwest, and rush together. The angle between the southe limit of the southwest clouds and the northern limit of the northwest clouds, wh several miles distant, was about 45°. The angle of elevation was about 35°. Besid these underclouds, there were overhanging masses of cloud. Saw the funnel-for distinctly after the storm passed. It appeared to be twice as broad at the top as t bottom. It looked like a screw turning contrary to the hands of a watch. When thr quarters of a mile distant, it subtended an angle of 25°. Hail fell about half an ho before the storm, with a gentle east wind. When the storm had approached with half a mile, the wind came so strongly from the south as to blow a man off his fe It rained a little some few minutes after it passed, with a west wind. About twen minutes after the tornado, a light shower fell, accompanied with a northwest wind about twenty-five miles per hour. Saw lightning in the northwest before the stor

John Maughlin, Cedar Township, section 25: The storm-center passed right over M Maughlin's house He testified that he saw a complete funnel-form about two hu dred yards distant, and that it went up into an overhanging mass of cloud. The fu nel was perfectly opaque, and left a fog behind it so that nothing could be seen for se eral moments after it passed. At the distance of two hundred yards, it appeared be only 15° in height. Saw no lightning.

The outhouses on this farm were badly damaged. The accompanying sketch sho the position of the ruins. The arro point in the direction toward whi the buildings were blown dow The fences were blown toward t storm-center. Those at the cent were carried away.



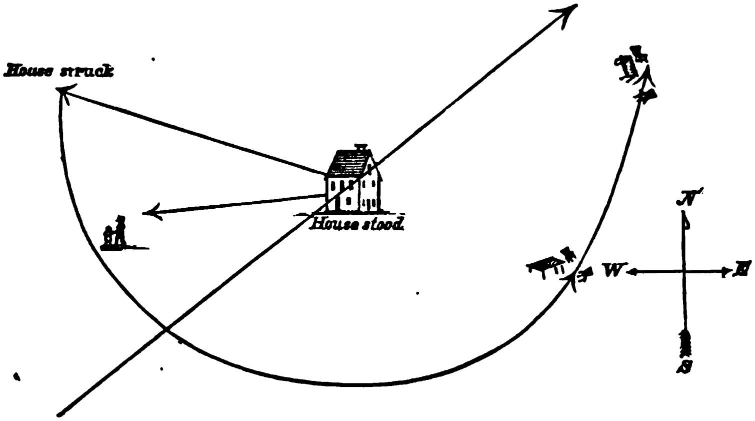
Andrew McKee, Cedar Townshi section 30, witness: The time w 3.10 p. m., precisely. The cloc which had just been cleaned a regulated, was thrown down a stopped at 3.10 p. m. Previous to t tornado, the lightning was warpi incessantly like a snake among t dark-blue clouds in the northwe Chunks of ice about one inch in ameter fell previous to the tornado, accompanied by a light east wind.

I, myself, saw the clock above mentioned. It still pointed to 3.10 p. m. Mr. McKe house stands fifty yards within the northwest limit of the storm-path. The buildin were partly pushed, partly blown down toward the south-southeast. The fences we blown to the southeast. A little empty house about forty yards to the east was blow to the southeast, and some of it was carried clear across the path of the storm.

The hedges along the east and west road are here filled full of *débris*, such as cor stumps, &c. On the southeast of the storm-center the *débris* is driven into the hed from the south, and on the northwest side from the north, but there is a greater exte of hedge with *débris* driven into it from the south than from the north. The positi of the *débris* driven in from the north seems frequently to have been subsequent affected by a west wind. The hedges running north and south have *débris* driven in them on the north of the center from the east, and on the south of the center from t west, but the extent of hedge with *débris* driven into it from the west is greater tha that with *debris* driven into it from the east. The hedges over which the storm pass looked as if they had been whipped violently against a wall, and then trailed in t mud. They were smashed and partially barked, and sometimes carried away. Th description applies to the hedges over which the whirlwind passed at any part of i course.

George Gilchrist, Cedar Township, section 29, (house directly in the center the storm-track,) witness: When the storm struck the house Mrs. Gilchrist, boy, and a child were in front of the west door trying to reach the cave, t boy and child being a step or two in advance. The boy and child were instan ly carried several rods to the west, while Mrs. Gilchrist was thrust back into t house. The house immediately went bodily, going a little to the north of the bo who saw it go past like the railroad, as he expressed it. Its sills struck the groun forty yards from their former position and the house tumbled over and went to piec leaving the inmates comparatively unhurt. As it went to pieces it was struck by west and southwest wind, the furniture being carried far to the east and northeas It grew dark as midnight when the tornado struck.

William Caldwell, Cedar Township, section 29, witness: When the storm struck the house the inmates were in the kitchen, which was a separate building. The wind blew so hard as to threaten to blow in the south door. Four strong men placed themselves against it. The hinges and lock were partly broken. These four men barely held the door with their utmost strength until the house went in a body. The men found themselves, together with the other inmates, a few yards to the north, lying among *débris*. The door was found a quarter of a mile away. It presented to the wind an area of 18 square feet.



Sketch of effect of storm at Gilchrist's house.

Mr. Caldwell's house stood on the southeast edge of the most violent vortex. It was first pushed 6 feet to the northwest, plowing up the ground. The resistance of the ground and of tree-roots here stopped it. It then turned up on its edge, and was lifted over the tops of trees 20 feet high, without injuring them, and carried 100 feet to the northeast, falling entire, and going to pieces as it fell. The house stood with its end to the south. The area of this end was 280 square feet or thereabout. The area of the floor of the house was 480 square feet or thereabout. The weight of the house could not have been less than twenty tons. The trees over which the house was carried are young, and were probably so bent as to allow the house to rise at an angle of 45°.

A heifer, weighing seven hundred pounds, was carried away by the wind, and thrust head foremost into wet soil until her forequarters were buried.

R. M. Stevenson, Jackson Township, section 25, witness: The wind blew from the southeast as the storm came up, changing to north as it passed. The rain came with the north wind. Saw the funnel make two dips and touch the ground. The top of the tornado, when seven hundred yards distant, appeared at an angle of 35°.

The house of this witness stood a quarter of a mile southeast from the center of the storm. The outbuildings were somewhat damaged.

T. P. Harbaugh, Cedar Township, section 13, about one mile from edge of storm, testified: That he saw it go straight forward without stopping. Saw it rising and falling.

A. Booth, Cedar Township, half a mile northwest of storm: Saw it twenty or thirty rods northeast of Frank Brown's. Saw it whirling against the sun. The wind came from the east before the storm and from the northwest after it.

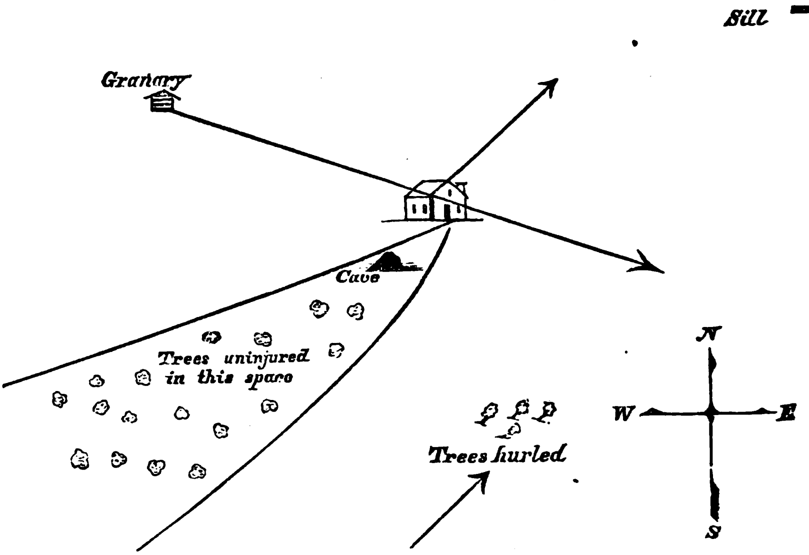
R. Finney was on the northwest side of the center, about one mile distant. He testified: When it was directly opposite, it appeared to reach up to the clouds. It subtended in width an angle of about 35°. In height it appeared to subtend an angle of about 40°. The bottom of the funnel was perfectly black. When it struck a house, could not see the house. Thinks it was lighter a little way up. Could see a roof carried up and fly to pieces. About fifteen minutes before the storm it hailed a little, and it rained for ten or fifteen minutes after. The wind, when the hail was falling, was from the northeast.

John Gordon, Cedar Township, section 25, one-half mile southeast of the center: It hailed about half an hour previous, with a southeast wind. The wind was from the west, as the tornado was opposite. No lightning was seen.

Laurie B. Mauck, teacher at Prairie Flower school, witness: Called in the children at 3 p. m. The tornado was opposite certainly not later than ten minutes afterwards.

Thomas Waters, Jackson Township, section 19, witness: Saw the tornado coming rolling on the ground like a wave. Went to the cave and called upon Mrs. Waters to ollow. She would not. Stood in the mouth of the cave, which was eight yards south

from the house, and facing it, and saw the house blown away. It was struck fr
southwest. First, a portion of the roof was blown off, then the house went bo
like lightning. When the house had gone I came out of the cave and was blow
the east-southeast.



Sketch of Mr. Waters's house.

Mr. Waters's house was 30 by 16 by 11 feet without the roof. It was carried, sill
all, twenty-four yards down a declivity without being turned round or tilted o
When it struck the ground, it at first merely shaved it with the foremost sill, gra
ally going deeper until the resistance became so great as to cause the house to t
over, when it went to pieces. The ground was plowed up about two feet at the de
est point. The house had fallen three feet in traveling twenty-four yards. Its wei
was at least ten tons.

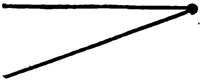
Between the cave, which was only about four feet above the surface, and the ho
but nearer the cave, stood a small tree. Against it a spade was leaning. Mr. Wat
testified that it was not blown down. Two yards east of the tree stood a bucket c
taining a small quantity of lime, and weighing ten pounds. It was not disturbed.
the southwest of the cave the trees were comparatively uninjured over a triangu
space, while on either side they exhibited signs of the greatest violence. An oak
which had evidently been carried with the house until it struck, and then hurled
east, was driven four feet into the soil at an angle of 45°. Its dimensions are 16 feet
8 inches by 8 inches, and its estimated weight three hundred pounds. It was fou
eighteen yards east of where the house struck.

Mrs. Waters was carried with the house until it went to pieces, and received inju
of which she died. The fragments of the house were carried far in the line of t
storm.

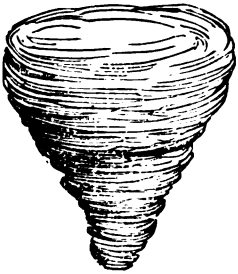
Alexander Gibson had two houses, both situated as nearly as possible in the cen
of the storm. The first house struck was taken away without touching the grou
and went to pieces in the air. The other house, in which were seven persons, w
swung round on its northwest corner, as on a pivot, the south end traveling 36 feet a
cutting up the ground as it went. It then turned over and was demolished. Duri
this journey the floor was broken up and three persons fell into the cellar. The hou
was a large one. It afforded no good basis for calculation on account of the irregular
of its shape. A granary was pushed due east 14 feet. Its dimensions are 16 by 16 b
feet. It is strongly built of generally hard wood, and divided into compartments.
was full of grain. The weight of the building and grain was given at 60,000 poun
The resistance to its forward motion was very great, because it was surrounded wi
wet straw and rubbish, of which it had pushed quite a pile before it. It was rack
by the strain which had been put upon it. Missiles had been driven through thr
hardwood planks, in succession, of an inch thick. They consisted of small pieces
wood, but had been removed. A plank 16 feet long, 2 inches thick and 1 foot wide, w
driven 4 feet into the soil, at an angle of 45°. A corn-sheller, weighing six hundr
and forty pounds, was carried four hundred yards and destroyed. Trees were bark

t without any symptoms of electric action or of explosion. The general position of ees and ruins was entirely corroborative of what has been already proved by an erwhelming mass of evidence, viz, the rotation and direction of rotation of the orm.

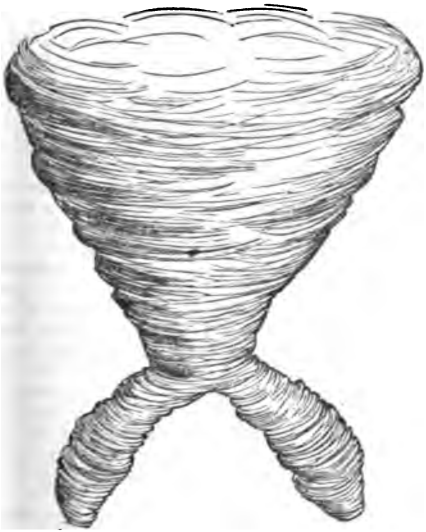
J. K. Marbourg, Jackson Township, section 17, witness: (House eighty yards from orm-center, with an excellent view of Gibson's house.) Watched the storm a long ne before it came. The west was first filled with clouds which extended until they vered all the western and northern heavens reaching a little beyond the zenith. ne tornado first appeared as two clouds, one from the southwest and the other om the west rushing to one point. Together they presented somewhat the appearce of an arrow, thus—



e whirl was seen forming when they met. Above them were dark, heavy clouds hen the tornado came nearer it presented the appearance of one funnel, revolving ntrary to the hands of a watch, and drawing everything up, thus—



When at Gibson's house, where I had the best view of it, and where it was one hundred d twenty rods distant, it presented the appearance of two funnels uniting in one, at e height of 40 or 50 feet. The bases of the two funnels were about 200 feet apart. ey presented somewhat like the following appearance. The two funnels did not pear to revolve around each other. The first came to the east of Gibson's house, took s stable, and then turned back to his house. The two then appeared to unite. Could ot see the two afterward. The tornado disappeared behind a building. It grew ery dark. The funnels were of a dark blue. Everything in them was rising. The



timbers from Gibson's house flew up. Did not see clear sky through the open space between the two funnels, but a bright yellowish hue. The upper funnel extended to the clouds above. Hail, or rather chunks of ice, from a pigeon's to a hen's egg in size, fell before the tornado column came in sight. The wind then blew gently from the east. After the tornado had destroyed the school-house, there came a violent gust of wind from the northwest, which considerably damaged my out-buildings. I had started to go to the school-house, and it carried me several yards before it. Immediately there fell a torrent of rain, with cold wind from the north. Was near where the school had been, but could not see anything. Suddenly saw the teacher and children, as if they had sprung out of the earth. They were coming toward me. They were shivering. They could give no account of what had befallen them. Never saw such miserable-looking beings in my life. I had four children there, and did not recognize them. The mud was pelted into their skins, so that it could not be washed out. It is not all washed out yet. A dead child was found forty yards northwest of the school-house. The storm opposite my house was a mile wide. An oak-post 4 inches in diameter was perforated by an oak-board 4½ feet by 4 inches by 1 inch. (It had been thrown among the other rubbish and was not to be found.)

James Clancey, residing with J. K. Marbourg, testified that he viewed the tornado from the same position as Mr. Marbourg and saw only one funnel. I do not, however, estimate his observing powers so highly as those of his employer.

David Canier, Jackson Township, section 20, witness: Watched the funnel as it approached. It was perfectly dark in it. Could see boards flying out at the top of it. It was very large at the top and small at the bottom. It grew dark as night. Six persons took refuge in the cellar. The house went immediately like the clap of a hand, and the darkness was already gone. Then it turned pretty dark again, and rain fell in a sheet. It did not fall in drops. It was all over in a minute. Things in the cellar were not much disturbed. Bottles stood where they were.

Alexander Gibson, witness: Was at Mr. Canier's house. Hail as large as pigeons' eggs fell about twenty minutes before. Heard the noise about half an hour previous to the storm. Saw clouds coming from the north and south, and rushing together. Saw the funnel when three miles distant. Watched it when thirty or forty rods distant. It was then as black as night, with boards flying around it. A very strong wind was blowing. It grew dark as midnight. Rushed down into the cellar, and was barely down when the house was struck with a sharp, instantaneous rap, and in a moment it was gone. It was dark when I went down into the cellar. It was pretty clear as soon as the house went. It then grew darker again, and a tremendous rain came down. Saw no lightning. Heard no thunder. On my farm a beam was driven right though a hog.

Mr. Canier's house was 24 by 28, by 14 feet to the eaves. It was pushed 18 feet due north without touching the ground. Its edge then came in contact with the soil and with tree-roots, having fallen two feet from its original position, and the house toppled over, and was blown to fragments. The ruins were carried first to the northwest and then around to the northeast. Heavy oak-sills were carried hundreds of yards and broken. The strongest iron-bound machinery was knocked to pieces, and carried away. The sickle-bar of a Buckeye machine was carried thirty rods. A beam 14 feet by 6 by 6½ inches was driven 3 feet into the soil in a slanting position. The beam weighed about fifty pounds.

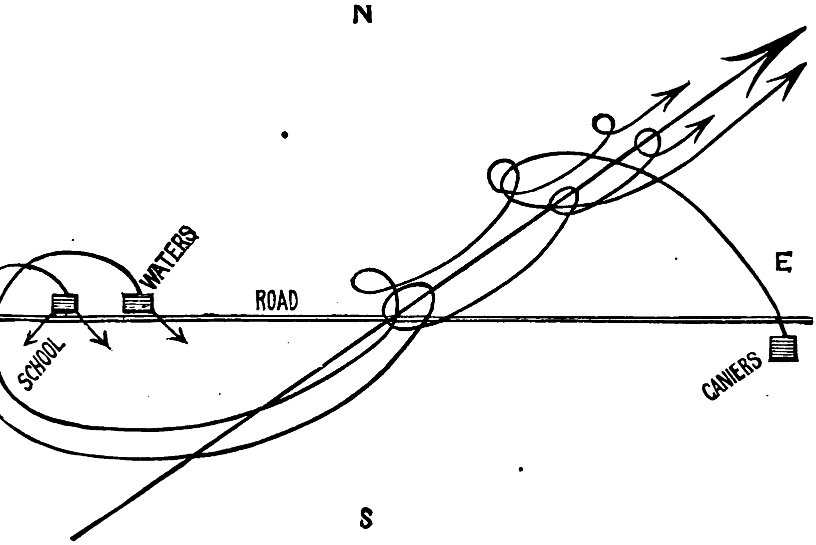
A half mile to the west of Mr. Canier's house stood the school-house already mentioned and a house occupied by Henry Waters. Between these buildings and Canier's house, and about one hundred yards to the northwest of the latter, passed the storm-center. The house occupied by Mr. Waters and the school-house were first blown to the northwest, and then in a circle by the south around to the northeast. A hedge ran along the road which connects the houses. It presented the appearances already described.

The house occupied by Mr. Waters was first blown to the northwest, the sills remaining. The sills were afterward blown to the southeast. The sills of the school-house had likewise, after being deserted by the house, been pushed to the southwest, and finally the position of the *débris* among the ruins showed there had followed a violent wind from the northwest; thus a tree lay across the foundation of the school from the northwest.

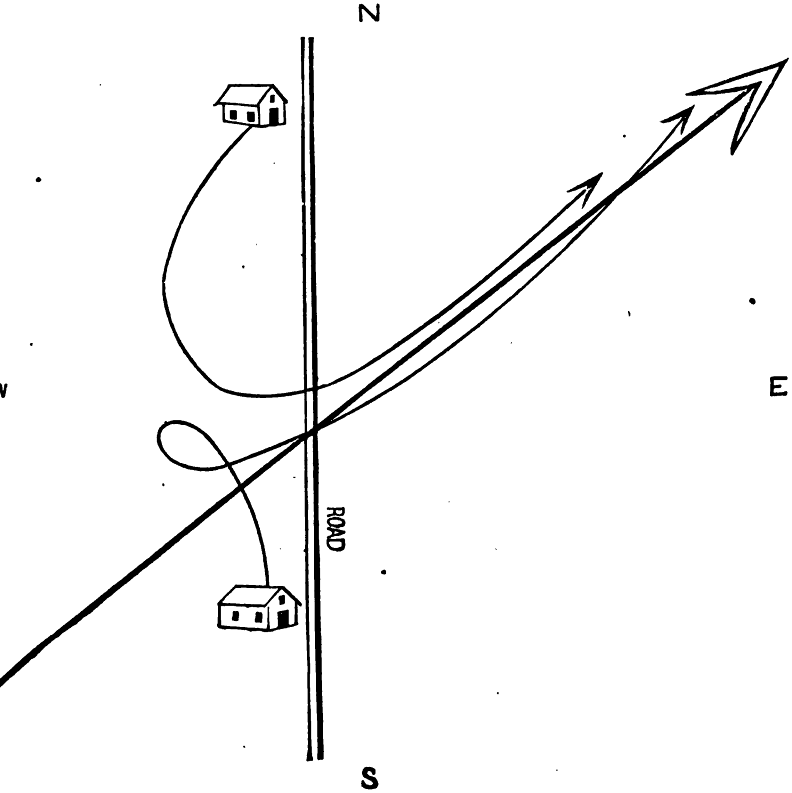
L. B. Babcock, son of J. P. Babcock, Jackson Township, section 17, witness: Hail fell before the storm as large as pigeons' eggs. Ran to get into the cellar. Cellar-door was blown over me as the house went. Came out of the cellar immediately, and was blown south. The rain then came down in sheets, with a north wind. The shutters from the house were carried three or four miles at least. Jacob Zeck got only partly down the cellar-stair and was hurt in the head.

J. P. Babcock's house was 34 by 26 by 14 feet to the eaves. The gable-end faced the wind. The house was pushed bodily toward the north, crushing the northern foundation; tore up the ground a short distance, toppled over, and went to pieces. It stood on the southeast of the storm-center.

cob Zeck, Jackson Township, section 17, witness: Was going down Babcock's cellar-
s when his house flew away, and injured my head severely.



Representation of effects of the storm at these houses.



Sketch of the effects of the storm at Babcock's and Zeck's.

Mr. Zeck's house stands on the northwest edge of the storm. It was pushed from i foundations 12 feet to the south-southwest, plowing up the ground. The windows the north side were smashed in. The windows on the south and east were blown ou A hay-stack was entirely blown away. It went, as could easily be traced, first sout southwest, and then round in a circle to the northeast. It went forty rods south b fore turning east.

The distance between these two houses was about half a mile. At this point t storm-path turned a little nearer north than northeast.

J. H. Laughhead, Jackson Township, section 16, witness: A little hail fell before t storm. It rained awfully for half an hour after it. Wind, during the rain, was fro the northwest. It was very dark. Saw no lightning.

The house of this witness stands on the northwest side of the storm-center, about on third of a mile distant from it. The fences were blown the usual way.

Levi Moothart, Cedar Township, about two miles north of the path of storm, witnes There fell the heaviest rain I ever saw; also hail as large as hens' eggs. The rain last about an hour, and the whole country was under water. The wind, during the rai storm, changed from south to west and north, and at times it was very strong.

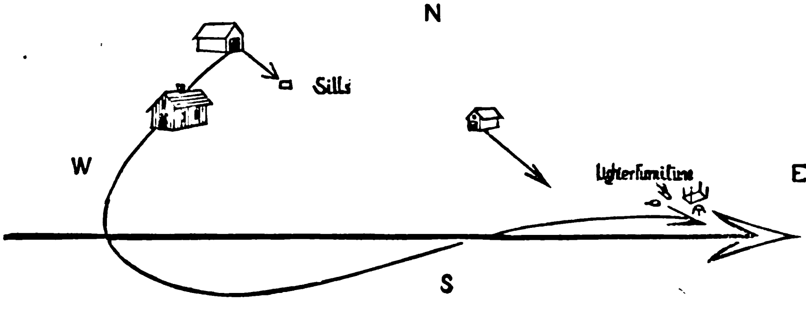
F. M. Curry, Jackson Township, section 9, tenant of John Flack's house, witnes The family went to the cellar. The house went south. No one injured. Eighteen pi blown away.

The house was pushed 45 feet due south and then went to pieces. No explosion. was situated to the northwest of the center.

E. N. Wright, Jackson Township, section 10, witness: Was on the southeast side the storm. Saw distinctly, at the distance of two miles, the tornado in funnel-sha The small end was down. Saw wood whirling. Heard its roaring after it went ea There appeared to be a mist or steam in front of it. It rose and fell. A few hailston fell before the tornado and an exceedingly violent rain after it.

Mr. Wright's house stands on the northwest of the center of the storm-path, abo fifty yards from it. A wood-house and kitchen were blown southwest. The dwellin house, a large, strong structure, was moved one inch to the east. A stove weighi four hundred and fifty pounds, and exposing to the wind a surface of 3 feet by 21 inch was pushed 12 feet to the southwest, where it was stopped by obstructions. A be weighing one hundred and fifteen pounds, not under any circumstances exposing greater surface than one square foot to the wind, and mounted 12 feet high, was brok from its fastenings and carried 60 feet south. A granary, measuring 28 by 16 by feet, and weighing, together with the grain, fifty-five thousand pounds, was carri twenty-one yards to the southeast. After plowing up the ground 2 feet in depth tumbled over and went to pieces. It was carried down a declivity, falling 6 feet. T width of the storm-track here was half a mile.

J. T. Anderson, tenant of J. C. Cunningham, witness: Was at Grand Prairie U. church, three-quarters of a mile northwest of storm-center. The wind blew so strong as to endanger the building.



Plan of ruins of Cunningham's house.

J. C. Cunningham, Jackson Township, section 11: The house of Mr. Cunningha stood on the northwest of the center of the storm-track, yet within the most viole vortex. The house was blown to the southwest; but the east door having been blo in, the house went to pieces without tumbling over, and the floor remained upon t ground. The lighter furniture, &c., was carried far to the east. The granary stood to t northeast of the house. Its contents were emptied into the house-cellar. The sills the granary had remained when it was carried away. They were afterward push to the southeast. A barn was blown to the southeast. A hog, weighing two hundr pounds, was carried five hundred yards. A cow, weighing one thousand pounds, w carried two hundred yards.

ere were four persons in the house and none were killed. The path of the storm re five hundred yards wide and nearly due east.

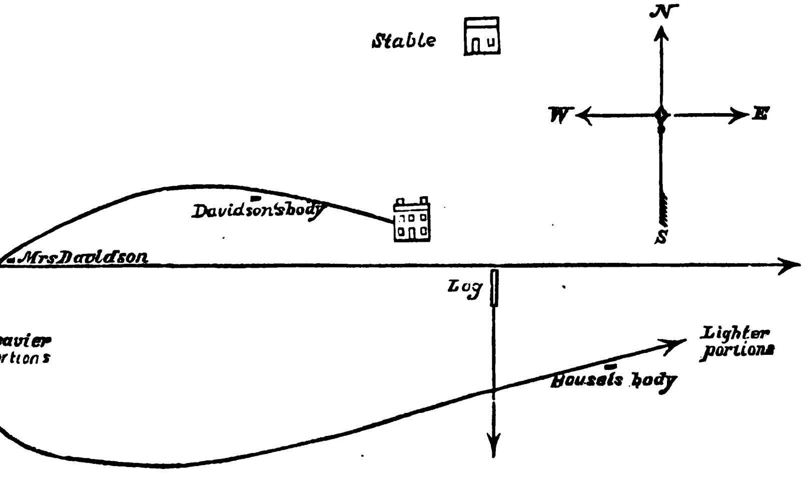
T. Carringer, Jackson Township, section 15: The house stood on the south edge ie storm. It was carried to the northeast 17 feet, going deeper into the soil as it ;. It then turned over and was blown away in fragments. The straw among the showed that the last gust came from the northwest.

siah Condit, Jackson Township, section 11, witness: No hail fell before the tor- . It rained terribly right after it. The wind was blowing from northwest as the fell. Saw no lightning.

. Condit's house stands upon the southeast edge of the storm, which here traveled ly due northeast. There seems to have been a streak of exceptionally strong north- wind, which struck the barn and corn-crib, and cut its way through the gar- fences. The center passed along the fields, producing upon fences and hedges the effects as those already described.

e next house struck was that of J. M. Davidson, Highland Township, section 7: ood precisely in the storm-center, which here, as if conscious that this was its last m in Iowa, seems to have exhausted its utmost violence. The house, 18 by 12 by et, was blown bodily from its foundations down a declivity toward a slough. It r touched the ground, but was shattered in the air. It seems to have been carried nearly due west, and then the lighter portions round in a curve to the east. The of Mr. Davidson was found twenty yards west of where the house stood. The l was blown still further in the same direction. Mrs. Davidson was carried about iundred yards west. The body of Leyden Housel was found to the southeast. The ier portions of the house were found some hundreds of yards to the west. Mr. sel's body had evidently been carried west with the fragments of the house and back to the east. Mrs. Davidson and the child escaped with their lives.

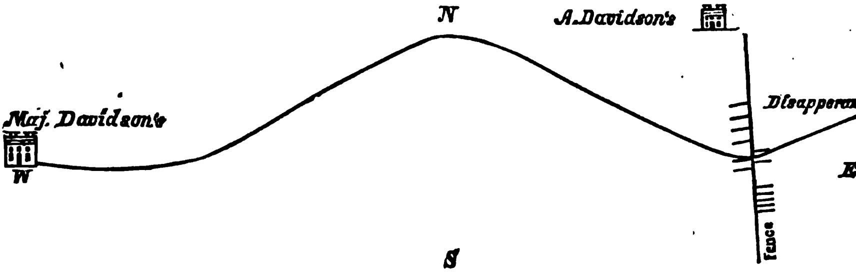
log of green water-elm, 7 feet in circumference, 8 feet in length, and weighing ast a ton, was carried fifty yards straight south. A horse, weighing one thou- and eighty pounds, was carried forty-five yards. A hog, weighing three hundred nds, was blown thirty yards. The stable and barn were blown south. An iron , with wooden handles, was carried one hundred and fifty yards. The strongest -bound machinery was utterly destroyed. The young trees in the orchard were er barked or torn out. The storm was exceedingly violent for a breadth of one lred and fifty yards, but fences were blown down for nearly a mile wide. At the e of Thomas Davidson, a quarter of a mile to the north, the wind blew so strongly the door had to be held. The north wind was evidently subsequent to the east l, because the house could not have stood such a wind.



Plan of the ruins of J. M. Davidson's house.

. Davidson, Highland Township, section 7, witness: It commenced to rain about ten wenty minutes before the arrival of the tornado. Shingles and other stuff began to with the rain. Then went out to see where they came from. Saw the tornado nt thirty rods distant. It appeared to be coming toward me. Saw it bend to the theast. It was funnel-shaped and as black as possible. It whirled. Thought it irled with the hands of a watch. It passed twenty rods to the south of the house and bent again to the northeast. When thirty rods distant from the house it suddenly disappeared. Afterward saw another funnel, not reaching to the ground, traveling toward the northeast. When first seen it appeared to be only 60 feet above the ground at its lower end. The farther it went the higher it seemed to get.

Mr. A. Davidson's house is situated one-half a mile east of where J. M. Davidson's house stood, and a little north. The shingles and other material he saw falling came from his brother's house. The following sketch shows the direction of the storm-path after leaving Major Davidson's place until it ceased to touch the earth as a funnel.



Twenty rods south of A. Davidson's house it crossed a fence, exhibiting the same appearances as those already described. I was particularly careful upon this point, because of Mr. Davidson's belief that the funnel whirled with the sun. I thought it possible that the tornado, before lifting from off the ground, might have changed its direction o rotation. But the evidence to the contrary was so striking that Mr. Davidson at once, upon my pointing it out to him, admitted that he must have been mistaken. He had not paid particular attention to the matter, and it was very dark when his observations were being made. The fence in question ran north and south. It was only thrown down for a space of sixty yards, and the boards were not carried away except in the middle. The posts remained in the ground, those on the north of the center leaning west and those on the south leaning east. The posts in the center were leaning some one way, some another. The funnel disappeared upon a knoll in the midst of a hollow about one-half of a mile in diameter. There was no *débris* deposited at this point, nor were there any signs of a cataract of water having poured down. The wheat, however, was mown as low as possible, and the ground looked as if it had been baked, according to Mr. Davidson's statement. The funnel had narrowed to a point before it disappeared.

After leaving Mr. Davidson's the tornado-cloud traveled to the southeast. Its progress was now difficult to trace, because of the little attention usually paid to a dark cloud, a high wind, and a rain-storm. Considerable time had also now elapsed since the meteor passed.

James M. Mace, Highland Township, section 8, had several panels of fence blown down by a westerly wind. A few small hail fell before the wind and a very heavy rain after it.

J. W. Haskett, Highland Township, section 9, witness: Six or eight panels of fence on my farm were blown to the southeast. A few hail and some rain fell. The wind was from the northwest when raining. Saw some lightning. Heard roaring about one-half an hour before it came. Saw funnel strike the ground. Saw it rise at Davidson's. Saw it strike the ground afterward. The wind blew very hard.

This witness's house is two miles from Davidson's.

William Dennis, Highland Township, section 10, witness: A few panels of fence blown down to the east. Small pieces of boards, shingles, and laths were dropped. It hailed a little before and rained a good deal after. The wind during the rain was from the northwest.

John W. Guthrie, Highland Township, section 11, witness: A few panels of fence were thrown down to the east.

George Wallace, Highland Township, section 11, witness: Heard roaring. It grew very dark. A high wind about one-half mile to the south of witness.

J. H. Lyttle, Highland Township, section 12, witness: Had nearly half a mile of fence thrown down. The east and west fences were blown south; the north and south fences east. Heard roaring an hour before the storm came. The roaring was louder before it came than after it was here. Did not hear it after it passed. Saw the funnel until it came within three miles' distance. The whole northern portion of the sky was covered. Saw a cloud rushing from the south and another rushing to meet it from the north. The clouds rushing north appeared to be the lowest. After the clouds came overhead could see the lowest clouds rushing rapidly from the south. These were broken clouds. Through them could see a higher current rushing from the north. A ttle hail and rain fell. The wind changed from the south to the west and northwest s the storm passed. The width of fence blown down was about one hundred and fifty ards.

Michael McGuire, Highland Township, section 12: One-half mile of fence on the arm was blown down. The chimney was blown off and some trees leveled. All was one by a northwest wind. It hailed a little and rained very heavily.

The storm now passed out of Washington County into Louisa County, traveling outheast.

Joshua Luckey, Louisa County, Union Township, section 17, witness: The path of ences blown down on my farm was about six hundred yards wide. The fences on the vest of the center were thrown north; those on the east were thrown south. A few ail fell and a smart shower of rain. Heard no roaring after it passed.

Charles Crim, Union Township, section 20, witness: Fences, two hundred yards vide, thrown down to the southeast. The roaring was very loud for an hour previous o its arrival. Did not hear it after it passed. Saw no lightning. Saw a tongue of loud shaped like a funnel hanging from the clouds. It did not reach the earth. At rst it was hanging perpendicular. Then it commenced whirling like the tail of a uspended snake.

At this point I lost track of the tornado and could not recover it, although I spared either time nor pains. Only now and again could one find a man who could give ny information even of what happened on their neighbors' farms a week or two before.

John Colton, Columbus Junction, witness: There was some hail, a brisk wind, and tremendous rain.

Mrs. Snyder, Oakland Township, section 9: Heard roaring distinctly. There fell a ery heavy rain, which continued until nearly dark.

Peter Attig, Johnson County, Tremont Township, section 22, witness: About 4 p. m. here was a terrific rain-storm, with hail as large as hickory-nuts, and accompanied vith thunder and lightning. My barn was struck by lightning. Perkins's barn was lso struck.

Lone Tree Station: About 4 p. m. there was a violent storm of rain, hail, thunder, nd lightning.

Nichols Station: There was here a high wind, with heavy rain and hail, and accom- anied with thunder and lightning.

At this point I gave up the search and took train for Illinois. Previous to describing ts effects there, the following testimony may find a place:

H. C. Vittitoe, Warren Township, Keokuk County, about three miles northwest of he tornado, witness: Saw a little south of the zenith the white under-clouds rushing n circles to a center. The gyration was contrary to the hands of a watch. The funnel ad not yet touched the earth. The wind came from the northwest pretty strong after he passage of the tornado, bringing with it a little rain and hail.

Dr. W. D. Hoffman, Sigourney, witness: Mrs. A. T. Page collected a number of the argest hailstones. When melted it was found that they had contained a quantity of wigs, leaves, dry grass, and mud, all reduced to fine proportions. Hail weighing from our to eight ounces were common. One hailstone which was shaped like an apple, meas- red 4½ inches in diameter. The roaring was heard about twenty minutes before the ail began. It rose and fell like the cannonading in a battle. During the hail the vind came from the northeast, but it was very light. Sigourney is four miles north f the storm.

Isaac Farley, Foote Town, Iowa County, twelve miles north of Keota, witness: There was very little rain and no hail, but the sound was loud and distinct.

E. R. Eldridge, Washington, Iowa, witness: Watched the tornado from the roof of house. Did not see a funnel appearance. The roaring was very loud and the cloud ery black. The cloud appeared to bend forward. The elevation of its summit was bout 35°. The distance five miles. Its summit was completely hidden by an over- anging cloud, which extended south a little beyond the zenith.

Arthur Howell, who was at Yalton, Iowa Township, five miles north of the tornado, estified that hail larger than hens' eggs fell, and a terrific rain of an hour's duration, ccompanied by incessant thunder and lightning.

Extracts from a communication received from R. L. Jay, Harper, Keokuk County, hysician:

"Was in the village of Baden, Keokuk County, German Township, three miles to he northwest of the storm-path.

"The tornado maintained an upright position. It moved rapidly at times, at others eeming to remain quite still. It was apparently about a quarter of a mile in height, nd was funnel-shaped and very dark and angry-looking. It whirled with the hands f a watch. There was a continual whirling of the clouds above the funnel. This vas observed for some time after the storm had passed. Saw no lightning and heard o thunder. It was impossible to hear thunder owing to the noise of the storm, which vas terrific. The direction of the wind was northeast until the storm had passed, vhen it changed to the northwest. Rain fell in torrents. Quite an amount of hail ell of all conceivable shapes. Three were picked up weighing one-half of a pound ach. Half an hour after the storm the thermometer stood at 92°."

G. W. Brockway, Talleyrand, witness: No rain nor hail fell here. A heavy rain fe about one mile to the north. The edge of the cloud did not reach the zenith by a fe degrees.

Extract from the Sigourney News, May 28, 1873:

"While the cyclone was mowing its path a few miles south and east of Sigourney tremendous hailstorm visited this locality. We saw one hailstone which weighe eight and one-half ounces. The hailstorm was followed by a heavy rain, after whic the sun came out bright and pleasant for the rest of the day."

Extract from the Washington County Press of May 28, 1873:

"The writer was in a street-car, half way from Moline to Rock Island, at 4.30 p. m on Thursday, when it was struck dead ahead by the most terrific wind and rain-stor we ever experienced."

S. J. Mather, editor Wilton Chronicle, Iowa, witness: Between 4 p. m. and 6 p. m. very dark cloud passed over, which poured down a very heavy rain.

Extract from the Chicago Tribune, May 25, 1873:

"At Muscatine the rain came down as if the flood-gates of heaven had been opene followed by hail. Between there and Wilton Junction, at Monona, Fredonia, an other stations along the southwestern division of the Chicago, Rock Island and Pacif Railroad, the country was flooded."

The tow-boat Victory lost her pilot-house and smoke-stack when near Buffalo, o the Mississippi. The tug Nonesuch lost her smoke-stack and pilot-house at Molin She was driven ashore.

A. H. Swan, editor of the Monmouth Review, witness: There was an exceedingl heavy rain, a little hail, and a great deal of lightning about 5 p. m. The atmospher smelt as of brimstone previously. It was oppressively hot; perhaps 95°.

The temperature and pressure on May 22, 1873, at places near the tornado:

	Davenport.		Keokuk.		West Unio	
	Bar.	Ther.	Bar.	Ther.	Bar.	The
7 a. m	29.73	64	29.64	69	29.49	61
2 p. m	29.60	77	29.51	85	29.46	65
9 p. m	29.69	66	29.71	72	29.53	64

The condition of the barometer and thermometer at West Union was obtained fro Frank McClintock, correspondent of the Smithsonian Institution, who also furnishes th following noteworthy fact: "Wind changed from the south to the west rapidly 3.45 p. m. It worked back to the south before 9 p. m." The relative humidity at—

	Davenport.	Keokul
7 a. m	94	85
2 p. m	77	54
9 p. m	94	85

We do not, therefore, overrate the relative humidity when we estimate it at 65 pe cent. at 2 p. m. The average temperature at the earth's surface in the line of th tornado at 2 p. m. was, from the above, probably 76°, but in the wooded hollows muc greater.

Mr. Jay, however, of Harper, Keokuk County, states that the temperature was 92 half an hour after the storm. The day was generally described as being very warm.

Having arrived at Prairie City, Ill., I endeavored to find out the exact locality wher the tornado first began to overthrow fences, damage buildings, &c. On the farm o James Williams, Point Pleasant Township, Warren County, there was a strong win but not sufficiently so to prostrate fences. About one mile to the east is the farm o Israel Jared, Point Pleasant Township, section 24. Mr. Jared testified as follows Saw streaks of cloud moving from the north and south toward each other before any thing touched the earth. Saw a cloud in the form and about the size of a haystac strike the ground on my farm. A few minutes before, hail of moderate size and i small quantity fell, followed, as the whirlwind was passing, by a smart shower of rai The wind, which had been southeast, changed to the west after the tornado passe It was pretty warm before, and cool after it. Heard roaring some five minutes pre vious to the arrival of the storm. Fences were blown down for two hundred yards wid They were blown toward the east. Saw some lightning. There was a heavy cloud t the north as the storm approached.

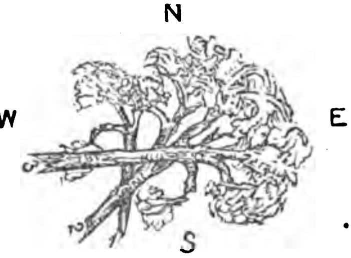
Mr. Jared's house stands about two hundred yards north of the storm-path. Th tornado was here traveling a little to the north of east.

John F. Tatman, Israel Jared's farm, testified that he saw the funnel strike the far and that he heard the roaring for a long time previous.

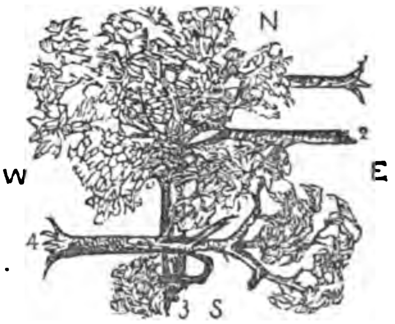
Before leaving this farm the storm had developed all the characteristics of a tornad except that the east wind was not yet powerful enough to destroy. The whirlwin then passed along a ravine full of tall timber. Nearly all the trees were uprooted o broken, but generally the latter. They appear to have had a firmer hold of the soi han those in Iowa. The breaking usually occurred about six feet from the ground nd the barking was almost entirely confined to the broken trees. The bark was torn ff both up and down from the place where the timber was broken. The trees, when ound, were seldom broken clean across. Half or more of the wood was severed, and he remainder was bent so as to allow the tree to rest upon the ground. The broken mber, when sound, invariably presented the appearance of a broom. The fibers of ach year's growth were loosened from the others and split. It was easy to obtain ieces ten feet long and as thin as a wand. This separation of the fibers had evidently een brought about by the excessive straining and bending of the tree before it fell. ach year's growth had apparently been snapped asunder by itself, beginning at the utside. The trees all lay as they had fallen, being, when once down, protected by he surrounding timber. If they had, after falling, been subjected to a wind from nother direction, so as to break them off entirely, they would have presented the recise appearances which have, by certain meteorologists, been attributed to the ac- on of electricity. Many of these broken trees were two feet in diameter. When a ee, still standing, had its bark torn off at any point, an examination generally showed hat the fibers of the tree were separated and perhaps partly severed at that point.

No. 1 lay beneath, diameter 8 inches; No. 2 lay above No. 1, diameter 26 inches; No. 3 lay above No. 2, diameter 26 inches. As the tornado increased in power the position of the overthrown trees varied more and more from a westerly direction; some weak ones lying from the south-southeast south of the center.

The following is a sketch of trees found in the center, one-quarter of a mile farther east than the above:



Sketch of fallen trees.



Nos. 1 and 2 lay beneath, diameter 6 ıches; No. 3 lay above Nos. 1 and 2, di- meter 18 inches; No. 4 lay above No. 3, iameter 15 inches.

Mason G. Buck, village of Swan Creek, itness: Saw a distinct funnel-shaped orm. It appeared to jump up and down) feet at a time. It hailed a little be- re the storm and rained a little after it. leard a roaring about twenty-five minutes before it arrived. Saw no lightning. Saw nly one funnel. Trees were blown down in my yard from the northwest. My house a half mile south of the center.

Leroy Putnam, near Swan Creek Station, witness: It looked like a top and whirled ontrary to the hands of a watch. Saw it rising and falling. My house is about half mile south of the center. It blew very strongly here. The tornado at this point as traveling east-northeast.

William Huston, Swan Township:

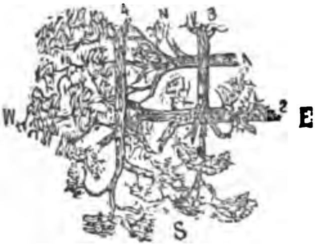
Mr. Huston's house stands on the north edge of the storm-path. The roof of the arn was blown to the southeast. A corn-stump about two inches in length was riven through the bark of a large tree, leaving its impress upon the wood.

John Worden's unoccupied house, one-quarter of a mile east of Huston's, was com- letely demolished. It stood near the center. The orchard was uprooted. Trees hich had stood one hundred and twenty yards southwest of the building lay with eir branches upon the foundations. The larger timbers of the house lay a few yards the west and north. The lighter were blown away. The breadth of desolation as here one hundred and fifty yards. At this place the tornado seems to have made ne of its sudden dips, the trees on the west and south being uninjured.

Shortly after leaving Worden's house the tornado entered the timber on the north ank of Swan Creek. It increased greatly in power and width as it did so. So long it followed Swan Creek, fences were thrown down over a space of from one to one nd a half miles wide.

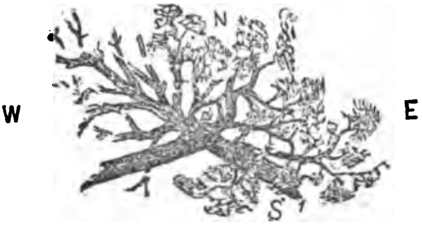
Franklin Booth, Swan Township, section 18, witness: Hailed just before the storm large as hazel-nuts, with a northeast wind. It did not rain much. Saw lightning oward the south. Mr. Booth's house stands on the north edge of the storm.

Abraham Stanfield, Swan Township, section 18: The storm-center is one-qu of a mile south-southeast of Mr. Stanfield's h The fences were generally thrown south. Amon Stanfield's timber, near the creek, the storm wr complete ruin. Three typical groups of fallen may be selected. Group I, a little north of ce Nos. 1 and 2 were blown down from the east an below Nos. 3 and 4. They were between one two feet in diameter. Group II, a little sou center, and seventy-five yards distant from G I: No. 1, blown down from the southeast, lay No. 2, blown down from the southwest. No. 15, and No. 2, 10 inches in diameter.

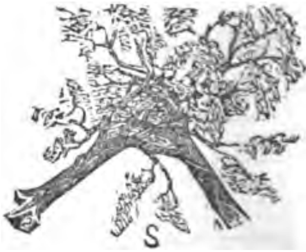


Group I.

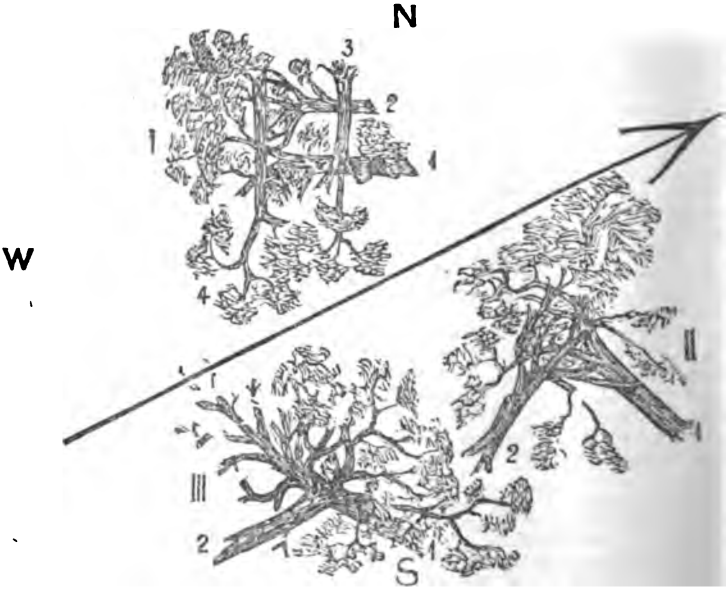
Group III, a little further south of center than Group II, and near it: No. 1, a decayed tree 16 inches in diameter, lay under No. 2, 14 inches in diameter.



Group III.



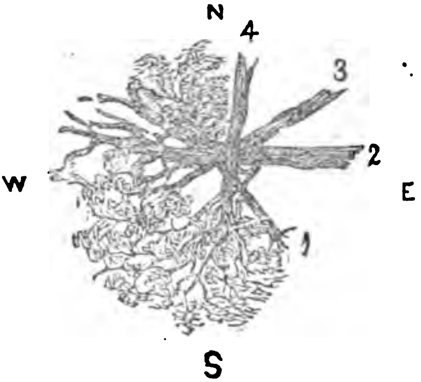
Group II.



The three groups combined.

The storm at this point overt all trees of any dimensions f width of two hundred and yards. The following group of trees was found about one-half a mile further on was just within the most violent vortex of fifty yards in width, and a little t north of the center. The trees lay as they fell: No. 1, 12 inches in diameter, the southeast; No. 2, 18 inches in diameter, from the east; No. 3, 14 inches i ameter, from the northeast; No. 4, 16 inches in diameter, from the north. was lowest, No. 2 next, No. 3 next, and above all lay No. 4.

The path of the tornado was here exceedingly well marked among the y trees. It could be followed by the eye as far as the ground permitted. They orn and bare, while all around was green. This barking of the young trees took lace within much narrower limits than those within which grown timber was verthrown. Generally they did not ex-end over twenty to thirty yards in width, nd were sometimes much less, and even lisappeared altogether. The trees exhib-ted the marks of the greatest violence on he side from which the storm came. The wigs were smashed and broken off, the ark partially removed, and even the tim-er bruised. These results were evidently he effect of a rush of missiles against he trees.



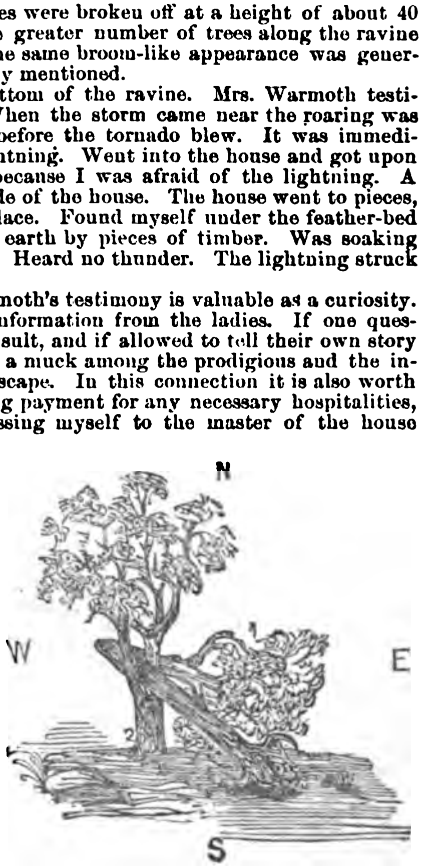
The tornado at one point suddenly nar-owed the path of extreme violence from ifty yards to twelve yards, at the same ime changing its course to the southeast. This change of direction brought it toward Swan Creek, along the northern bank of which it had hitherto been raging. Just s it struck the creek the track was nearly outh-southeast. Immediately thereafter it turned nearly due east, following the creek. The bottom of the ravine within which Swan Creek flows is about two hundred yards vide, is surrounded by steep and lofty bluffs, and was covered with large trees. Among these trees the whirlwind raved with the utmost fury, developing an energy urpassed at no other point in its career. Trees from three to four feet in diameter vere snapped or uprooted. Many large trees were broken off at a height of about 40 eet and left without a twig. By far the greater number of trees along the ravine vere thrown down from the southwest. The same broom-like appearance was gener-lly presented by the broken trees as already mentioned.

Thomas Warmoth's house stood in the bottom of the ravine. Mrs. Warmoth testi-ied as follows: Heard a roaring first. When the storm came near the roaring was ouder than thunder. A few hail fell just before the tornado blew. It was immedi-tely preceded by a very bright flash of lightning. Went into the house and got upon ny feather-bed, together with my child, because I was afraid of the lightning. A arge tree was blown down, catching the side of the house. The house went to pieces, he tree, however, keeping the floor in its place. Found myself under the feather-bed vith my child. The bed was pinned to the earth by pieces of timber. Was soaking vet. Everything was covered with mud. Heard no thunder. The lightning struck tree, depriving it of its bark.

I was unable to find this tree. Mrs. Warmoth's testimony is valuable as a curiosity. t was generally impossible to obtain any information from the ladies. If one ques-ioned them rigorously they took it as an insult, and if allowed to tell their own story hey immediately commenced running such a muck among the prodigious and the in-redible that one was glad to make his escape. In this connection it is also worth nentioning that although invariably offering payment for any necessary hospitalities, soon learned the wisdom of always addressing myself to the master of the house vhen asking for such.

No. 1 is a tree 18 inches in diameter. No. 2 is a tree 2 feet 6 inches in diameter, but orked at the height of 15 feet from the ground. No. 1 was blown from the south-ast between the forks of No. 2 and then alf broken close to the forks and blown rom the northwest until its top nearly ouched its root.

After leaving Warmoth's house the tor-ado-center crossed to the south bank of he creek, where it continued for nearly a nile farther, although somewhat increasing ts distance from the creek. It crossed to he south bank, where a smaller creek joins Swan Creek from the south. This brought t nearer to the house of A. J. Caton, Swan Township, section 15, which stands about ive hundred yards from the center of the whirlwind. Part of the roof was blown to he southeast and part to the northeast. A maller house was blown a few yards to the ortheast and inverted. A house on Mr. Caton's farm, tenanted by N. J. Reynolds, 14 by 20 feet and one story high, was carried



Group of trees near Warmoth's house.

eight yards to the northeast bodily. It then struck the ground, tumbled over, and wa blown to fragments. Its four inmates were carried from fifty to sixty yards, but no killed. It stood a little south of the center. After passing Mr. Caton's farm the to nado entirely left Swan Creek. Before tracing its further progress, it will be better t give the evidence of people living at or near Youngstown, about one mile south of th center:

Charles McCormick, Swan Township, witness: The tornado looked as large as a hous when three miles distant. A little rain and hail fell. The wind with the rain wa from the west. There was no wind to do any damage. House a quarter of a mil south of Swan Creek. Time, about 5.45 p. m.

H. W. Simmons, Swan Township, section 28, witness: The time when the tornad passed was about 5.40 p. m. Have good grounds for this assertion. A few minute before its arrival I noticed a very black cloud in the west with a lighter space on eac side of it. My house is three-quarters of a mile from Swan Creek. Did not hear th roaring very distinctly until it was nearly opposite. Then it was an awful ocean-lik roaring. Then it presented the appearance of a funnel apparently only a few rod across at the bottom. The top of it appeared to be from three to four times wider tha the bottom. Did not notice whether it entered an overhanging mass of cloud. I hailed a little when it was opposite. Fences were blown down fully a mile and a hal to the south of Swan Creek.

H. A. Folger, M. D., Youngstown, one mile south of Swan Creek: The tornado wa opposite about 5.45 p. m. Saw dark clouds in the west-northwest for an hour previou There were several bright flashes of lightning after the tornado. A few hailstones a large as bullets fell as the tornado was passing. It rained very hard for a few minute after. It was quite dark for a little time. Saw clouds rolling and tumbling. Th strongest gust came from the west-northwest.

In Youngstown a few chimneys were blown off and similar damage done. One hous was moved from its foundations to the northeast. Trees, in a few cases, were blow down, and all to the east. It is to be noted that, while at McCormick's house, a qua ter of a mile south of Swan Creek, along which the tornado passed, no damage wa done by the wind, at Youngstown, three-quarters of a mile further away, the gale wa almost strong enough to blow down houses. McCormick's house is somewhat lowe down and stands among trees.

After leaving Swan Creek the storm traveled east-southeast. The first house whic came in its way was that of Absalom Vandevere, Swan Township, section 15. He testified as follows: I have reliable information that two or three miles to the north th clouds were seen rushing south. The clouds came also from the south toward the to nado. Streaks of unusually strong wind seemed to come now and again from th south side and run into the main whirl. The wind on the north side was not nearly s strong as on the south side. Twice as much fence was blown down on the south as o the north side. Its noise resembled that of machinery, only very loud. The dimensions of my house were 36 by 42 by 18 feet.

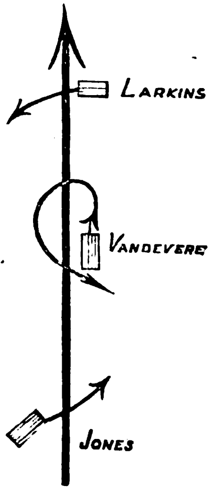
Samuel Larkins, Swan Township, section 15, witness: Was at Mr. Vandevere's hous when the tornado struck it. Heard roaring about fifteen minutes before it came When I first saw the funnel it did not touch the ground. Saw it whirling contrary t the hands of a watch, and the clouds were drawn in toward it on all sides. It di not lighten before the storm. It lightened a great deal immediately after it in th west. It did not hail nor rain. Did not see clouds in north or south. There appeare to be only a narrow strip of clouds. A McCormick reaper, weighing probably on thousand pounds, was carried ten rods from the south. Two horses were blown, th one fifty the other forty yards. An axle-tree, torn from a wagon, was carried a mil and a quarter to the southeast. A shingle was driven through a half-inch ash-board It is in the possession of a Mr. Thomas. A rafter, 8 feet by 2 by 4 inches, was drive through three hogs, and thrust into the ground a foot and a half. All three were on i when it was found. A picture-frame was picked up with the glass unbroken. Th wind blew very strongly for about two minutes.

Mr. Vandevere's house, 36 by 42 by 18 feet to the eaves, stood north and south lengthwise. It was moved due north half the length of the house, tumbled over, and blow to pieces. It stood with its north end exactly in the center of the vortex. There wer nine persons in the cellar and two in the house. One of those in the cellar was kille by a log. The trees around the house and within the narrow path of the greatest violence, all pointed to the east-southeast, the direction in which the storm was travelin

W. J. Jones, Swan Township, witness: Vandevere's house is forty rods to the north Myself and wife were in my house when it was blown away. It grew dark as midnight just then. There was a little hail before. Did not notice any rain. The hous did not go very fast.

Mr. Jones's house was 22 by 16 by 12 feet to the eaves. It was pushed entire five fee to the northeast. It then toppled over and was blown to pieces.

The arrow in the sketch should point E.SE.



ketch of storm-effects at Larkins's, Vandevere's, and Jones's houses.

The fragments in Illinois had already been gathered from the fields, rendering it more difficult to trace the ruins in their flight.

David Smalley, Swan Township, section 22, witness: There was quite a strong wind all day previous to the storm from the southeast. Saw some lightning before the storm. A little hail fell before it and a moderate shower of rain after it. The house stands on the south edge of the storm and was blown east-northeast one inch. It was very warm that day.

Edmund Jennings, Swan Township, section 22, a quarter of a mile south of the center, witness: While the storm was still in the west saw two funnels come together, the one from the north and the other from the south. They appeared to be both whirling, but contrary to each other. When they were still at a distance the sky was cloudy overhead. Their summits appeared to be lost in cloud. Saw lightning and heard thunder previous to the tornado. There fell a little hail before the storm and some rain after it. The trees, chimneys, and fences were thrown down to the northeast.

William Thomas, Swan Township, witness: The center of the storm passed a quarter of a mile to the north. An unoccupied house stood in its way. It was lifted from its foundations and then broken to pieces. Horses were carried a good way and killed. A rail was driven through one of the cattle, going in beneath her tail and coming out at her shoulder. Saw only one funnel.

Robert Wearmouth, Swan Township, witness: The storm-center passed three hundred yards to the north. It was traveling nearly southeast. Horses and cattle were blown a considerable distance. Saw two flashes of lightning before the tornado. Hail fell just before it, and as it was falling heard ome thunder. It was so dark when the storm was on us that it was impossible to ee anything flying.

Charles Thomas, Swan Township, two hundred yards north of the center and directy north of Wearmouth's, witness: The wind, which blew down trees, unroofed outhouses, &c., came from the northeast and north. Fences were thrown down nearly a mile wide.

Charles Perry, Swan Township, section 24, witness: House, 16 by 24 by 15, with gable-ends facing south and north, was carried to the southeast. There were four inmates, one of whom was mortally injured. Mrs. Perry, who weighed two hundred pounds, was carried one hundred yards and stripped of her clothing. Two horses were carried one hundred yards. Hogs had rails driven through them.

Mr. Perry's house stood near the center of the storm. The west side of the house was blown in and the house instantly broken up.

Caridan Johnson, Greenbush Township, witness: My house is three-quarters of a mile north of the storm-path. Saw no funnel-shaped appearance. Saw some lightning and heard thunder before the tornado came. A few small hail fell before the torm and a very hard rain after it.

B. A. Reid, Swan Township, section 24: Mr. Reid's house stood one hundred yards north of the storm-center. The north side of the house was not blown away, but blown down from the north. The wind had evidently driven in the windows and then burst the house asunder. Hogs, weighing two hundred pounds, were carried two hundred yards.

B. A. Reid, sr., Swan Township, section 25, witness: Saw two clouds, one in the northwest and one in the southwest, rushing together with great rapidity. A whirling commenced right where they met, assuming the form of a funnel. Saw it whirling with the hands of a watch at the distance of about two miles. These low clouds were overhung by a heavy mass of clouds. The funnel reached up to this mass. There was a little hail and a little rain. My house is less than half a mile south of the enter.

J. P. Reid, witness, Swan Township, section 25: There was incessant lightning to he northwest before the storm. Heard thunder also. When the storm was one and a half miles distant its angle of elevation was about 75°. Saw the funnel distinctly.

H. H. Hewitt, Greenbush Township, section 29, witness: Fences thrown down here or half a mile wide.

P. A. Vaughn, Greenbush Township, section 20, witness: Center of storm passed hree hundred and fifty yards south of my house. The strongest gust of wind came rom the northeast and north. Three trees, about ten inches in diameter, were carried one-quarter of a mile to the southeast.

Mr. Nichols, Greenbush Township: Mr. Nichols's house stood about one hundred and sixty yards north of the center. It appeared to have been turned over without being first pushed forward in a mass. It broke into large pieces, which were only carried a few yards. Eight persons were in the house and none of them were killed.

David Stookey, Greenbush Township, section 27: Mr. Stookey's house stands three hundred yards south of the storm-center. The corn-crib was thrown to the northeast. Mr. Stookey testified that he did not hear a great roaring, and that it was very dark.

Barney Sloey, Greenbush Township, section 26, witness: My house is forty rods south of the center of the destruction. Outhouses were damaged by a southwest wind. A wheel of a corn-planter was carried from Nichols's farm, on the north side of the storm-center, and deposited at my house, one mile distant, and on the south side of the center. A wagon-tire was carried two miles in the line of the storm. There was an ugly-looking cloud in the northwest for hours before the storm came up, and lightning was playing in it.' When the storm came near, its roar was like that of a cataract.

John Woods, Greenbush Township, section 25, witness: Heard no roaring. House is on south edge of the center. Had two miles of fences blown down; one horse carried forty rods; one cow perforated by a rail.

J. E. Gustine, Lawrence farm, Greenbush Township, section 16, directly north of Prairie City and one hundred and fifty yards to the south of the storm: When the cloud came up it became very dark, and the roaring was louder than thunder. Did not see any lightning. A little hail fell and a little rain. The lamp was lighted in the house, it was so dark.

John Van Winkle, Union Township, Fulton County, section 30, witness: The storm-center passed thirty rods to the north of the house. Remained out of doors all the time. Saw the funnel-appearance touching the ground a half mile distant. The roaring was so loud that I could not hear the breaking of the buildings. There was no crashing, but a whirring like that of a thousand threshing-machines. Everything on the south side was thrown toward the center. Most of the wood was deposited along the center. The storm lay in the northwest a long time, and during that time the wind was steady from the southeast. There seemed to be a dark cloud to the southwest, another in the northwest, and a clearer space between. The wind blew from the northwest as the storm passed.

E. G. Roe, Union Township, Fulton County, section 30, eighty rods north of Van Winkle's, witness: My house is forty rods north of the center of the storm. For an hour before the tornado arrived a heavy cloud had been lying in the northwest, with lightning playing in it. Clouds kept rising in the southwest and passing over to the northwest. From the clouds three points came down, from which rain appeared to be falling. There was clear sky between these points. The ruins of my barn were carried first a little north, then forty rods west, and then distributed along the storm-path for half a mile east. They could easily be traced, because the barn was painted red. At Joliet Creek, on this farm, the storm either widened or a branch came down the creek. The storm struck us a little before 6 p. m.

J. B. Hatch, Union Township, section 29, twenty rods to the south of the storm-center, witness: The storm struck us a little before 6 p. m. As the cloud and darkness came over, everything appeared to be enveloped in a white mist. There were no drops, but it wet everything. The carpets in the house had to be taken up and dried. The paper on the walls was covered with mud and fine-ground leaves. The strongest wind came from the southwest. Everything was collected to the center of the storm-path. Did not feel any choking sensation when surrounded by the mist. Did not feel cold. Boy felt chilly. It had been a very warm day. Saw lightning right in the storm.

An unoccupied house ten rods south of the storm-center was parted. The kitchen was carried to the north; the main body to the south.

Cornelius Ackerman, Union Township, a half mile east of Hatch's house and five rods south of the storm-center, witness: Saw storm gathering in the northwest and southwest for some time. Hail nearly the size of hens' eggs fell before the storm. A south wind took the roof off the house. A northwest wind then still further demolished it. The wind took me off my feet. My hired hand, Cornelius Rice, was thrown down by the wind and then pushed along the ground for several rods. He leaned on his elbow as he went. He first traveled north, and then in a curve round to the east, when he stopped his further progress by clinging to the branches of a tree. The ground was rather dry before the tornado. It was quite wet after it. Several hogs were transfixed with timbers. A shingle was driven into the sound butt of a white-oak beam measuring 4 by 4 inches. The darkness was black. The direction of the storm-path at this point was still east-southeast.

William McBride, Union Township, section 32, witness: Hail and heavy rain fell before the tornado. It then became black darkness. Three-quarters of a mile south from my house chimneys were blown down.

Mr. McBride's house stands apparently near the center of the storm, which here ns to have mitigated its fury somewhat. The barn-roof was blown to the north- heast. The barn itself was moved four inches to the south.

Johnston, Union Township, section 33: The wind commenced to blow very hard the south. Went into the cellar. Two small buildings were first blown to the h. The kitchen was blown southeast. The barn and other buildings went south. main building was pushed a few feet to the southwest. It grew so dark that one d not see ten feet. Some hogs and pigs were carried away, I do not know where. ie of the former weighed two hundred and fifty pounds.

r. Johnston's house stood exactly in the center of the whirlwind.

homas Poole's house stood to the east of Johnston's. It was demolished. I could see him.

ndrew Maholland, Union Township, witness: It was near 6 p. m. when the storm ick us. Felt the air to be very hot, like steam, before the storm. The wind at first ie strong from the east and was accompanied by a driving wet. The roof of the ise was blown to the southwest.

Ir. Maholland's house stands fifty rods to the north of the center.

l. S. Gorham, Union Township, section 33, forty rods south from Maholland's, and her on the north edge of the center: The house was carried entire a few yards to the thwest, struck the ground, toppled over, and went to pieces. The kitchen was ved a few yards and broke up, leaving the family upon the floor. Trees were blown wn from the northeast.

D. H. Gorham, Union Township, section 34, witness: The tornado arrived at my house 5.55 p. m. Saw the storm gather in the west-northwest one and a half hours before came. Saw a little lightning as it approached, but none after it arrived. Saw two ouds, one in the southwest and one in the northwest, with a red streak like sunset tween them. Afterward saw only one cloud, rolling forward like a wheel. Heard roaring a little before the storm arrived. It grew so dark that I could not read—a ack darkness. First there came a blow from the southeast. After that there came a ight lull, and hail as large as hens' eggs fell straight. Then there came a harder ow from the northeast. Then for three minutes there fell a perfect torrent of rain. ode out immediately, and the water on the road reached to the horse's belly. My tbuildings were damaged by the northeast wind. Fences were thrown down a mile ide.

Mr. Gorham's house stands fifty rods north of the center of the storm.

A. H. Miller, Union Township, section 35: The house of Mr. Miller stands on the orth edge of the storm. There fell a tremendous rain as the storm passed.

At D. M. Kline's farm fences were thrown down a mile wide. They were thrown oward the center from both sides. The storm at this point had greatly diminished violence.

O. Chatterton, Lee Township, section 1, witness: Heard the roaring only a few minutes efore the storm came. The wind blew first from the southwest, then from the northast, and then from the north. Saw no lightning. A tremendous rain fell about eighty ods south from the house. Thinks that this heavy rain did not extend far south. The ouncil Corner school-house was turned round.

John Schneider, Ellisville Township, had some fences blown down on the northwest ank of Spoon River.

H. Caril, village of Ellisville, witness: A very heavy rain fell during three-quarters f an hour. For six miles to the north everything was flooded. There was not much ightning. Heard a roaring, but not very loud.

Isaac Sechleider, Deerfield Township, section 7, across Spoon River: Mr. Sechleider's iouse stood near the summit of the bluffs which face the river. It measured 16 by 2 by 12. It was blown southeast three rods, and deposited on its roof. The five nmates were not much injured. The storm smashed the timber somewhat on the outheast bank.

About a mile farther on it became impossible to track the storm. Before proceeding o where it next struck, it may be advisable to insert some testimony from Prairie ity and the neighborhood. Prairie City is about one and a half miles south from he storm-path.

The editor of the Prairie City Herald testified that he thinks the storm was opposite a little before 6 p. m.

C. H. Hemenover, Prairie City, testified that oak-leaves fell during the storm, and that the wind blew very strongly from the south. He keeps a thermometer, but did not look at it that day. Thinks temperature was not over 70°.

L. B. Day, Prairie City, witness: Saw a cloud in the northwest of a funnel-shape; heard a roaring sound for perhaps five minutes. The wind blew strongly from the southeast all of a sudden, accompanied with hail about the size of pigeon-eggs. There was an undercurrent of clouds from the southeast overhead. Just as this southeast wind blew it grew very dark. After the tornado passed the wind changed to the northwest, and a smart shower fell. Then it cleared up, and the sun shone.

J. M. Kershaw, hotel-keeper, Prairie City, witness: It grew dark about 6.05 p. m.

saw clouds from southeast sent a-whirling as they struck the northwest clouds; saw continual lightning as the storm approached; heard roaring after the storm passed.

J. H. Day, Lee Township, about one mile south of the center of the storm, witness: There fell a very heavy rain, with north wind, so heavy as to flood everything in a minute. It filled a small creek so that I could not get home that night. I was one-half mile farther south than my house. The windows were smashed with hail on the north and east.

Wm. Henry, Lee Township, section 4, witness: Saw a heavy cloud in the northwest, and a less heavy one in the southeast. There was a lighter space between, but could not see the sky there. The wind blew first from the east, and damaged the outhouses. Afterward there came a northwest wind, with a terrible rain.

Samuel Taylor, Lee Township, section 20, four miles south of storm: It rained a little from southeast, and then the wind came more from the south.

A. T. Irvine, station-agent, Prairie City: The telegraph was not disturbed by free electricity during the passage of the tornado. It only ceased to work between this and Avon after the wires were broken by the wind. The wind blew from the southeast as the storm approached. It rained quite a while from the southeast. Then it changed to the southwest, still raining, and when the rain somewhat ceased, it came from the northeast.

H. M. Torseman, Prairie City, witness: Between Ellisville and three miles north of it, there fell a most tremendous rain. Logs and rails were carried into the roads by the water.

Having learned that the tornado had made another descent at Utica, near the Illinois River, I proceeded thither.

Jacob McCan, Utica, Banner Township, Fulton County, witness: Storm came about 6.30 p. m.; saw lightning and heard thunder in the northwest, where a heavy cloud had long been gathering; saw two under-clouds, one in the southwest and the other in the northwest, moving toward each other. They were wind-clouds. Above them was a dark-green cloud. The two clouds were whitish, and were boiling up. The sky to the east was clear at this time, the storm coming up as an isolated, solid mass of cloud. The wind commenced to blow hard from the southwest. Then there came a brief lull; then a second blow from the northwest. With the northwest wind there came a blue smoke. It came in through the broken window. It came right in the fury of the gale. It was all dark in front of the window with it. This northwest wind was pretty cool. It hailed a little before the storm, and it rained very hard after it.

Nearly all the houses in Utica were more or less damaged, and several were blown down. The village stands on the bottom-lands of a small creek running into Illinois River. High bluffs rise all around. The tornado was here traveling southeast. It came down about one-half mile to the northwest of Utica. It continued to overthrow trees until it reached Illinois River, which is distant from Utica about one mile. It then turned abruptly to the northeast, traveling up the stream, which it then followed for about fifteen or more miles in a straight line, but much farther counting the bends in the river.

Charles Rice, Fulton County, Banner Township, one and a half miles from Illinois River, just at the commencement of the wooded swamp bordering the river, witness: The wind blew down two trees in my orchard. It was a north wind. The storm-center was at least one-half mile nearer the river. There were a few hail at the commencement, and a heavy rain afterward.

M. B. Murray, Peoria County, Timber Township, section 31, and one mile distant from the river: The storm blew down a great deal of timber along the banks. Some trees were also blown down on the other side of my farm, on the summit of the bluff. A heavy rain immediately followed the wind.

A. King, Peoria County, Timber Township, section 31, witness: My house is one and a quarter miles from the river to the northwest. My fences were blown down.

A. Dempsey, village of Kingston, Peoria County: A few chimneys were blown off in the village, and similar damage done. Two cows were killed by lightning. Some timber on the river was blown down.

Kingston is situated on the bottom-lands of the Illinois River, and close to it.

Mapleton, Peoria County: Here there fell hail as large as hazel-nuts, and a very heavy rain, accompanied by thunder and lightning. It occurred after 6 p. m. William Harrison testified that he saw trees in considerable numbers which had been blown down in the storm of May 22.

Pekin: The ferryman testified that there was a big rain-storm with high wind. The smoke-stack of his boat was somewhat damaged by it. Mr. Tazewell stated that the high wind came first, then the hail and rain.

Fred. Netz, Washington, Illinois, witness: It blew very hard about 6.15 p. m. There was a heavy rain.

Thomas Handsacker, editor of the Washington Herald, Washington, Illinois: The storm came at 6.10 p. m., or very nearly. I watched the cloud. Did not see any funnel-appearance nor any whirling. There was a very heavy rain, accompanied with thunr and lightning. The wind blew down numbers of trees in different directions, but ostly from the southwest. Heard that at Eureka there was a considerable storm.

I accordingly went to Eureka, but found nothing of importance. Before closing the atement of facts, a few data may be adduced, showing the widely-extended area over hich the storm, or portions of it, manifested itself:

Special dispatch to the Chicago Tribune.

OTTAWA, ILLINOIS, *May* 23.

The tornado which passed through Central Iowa seemed to have spent its force here st evening. An enormous quantity of rain fell in an incredibly short time, and the ains on both railroads were delayed for hours. Bridges were swept away and much amage done. Ottawa lay directly in the line in which the storm was traveling when ceased to follow it.

Special telegram to the Chicago Times.

SPRINGFIELD, ILLINOIS, *May* 23.

A very heavy storm of wind, rain, and hail passed over this city last night.

Special telegram to the Chicago Times.

PEORIA, *May* 24.

The severe storm of Thursday night did much damage in Princeville, this county. narrow strip of wind passed through Southern Village, almost literally demolishing e house of Oliver Moody.

The following is an extract from a letter by B. Whitaker, chairman of the meteoro- gical committee, who resides two and three-quarter miles east of Warsaw, Illinois, in orrespondence with the Chief Signal-Officer:

"On Sunday, May 22, about 3 p. m., or perhaps a little later, while planting potatoes the field, a roaring noise was heard a little west of north. Being familiar with the oise of railroads, steamboats, &c., was at a loss to account for it. We stood and stened five minutes. The continued roaring noise indicated great force. A perceptible dication of its moving more to due north was manifest. After resuming our work e noise was heard for some time—ten or fifteen minutes or more. A dark cloud ccupied the heavens in that direction, the point or foremost end moving to the north- ast. The motion of the cloud was not easily indicated, on account of intervening and djacent clouds. My place of observation is two and a half miles due south of the gnal-station Keokuk, and two and three-quarter miles due east of Warsaw, and the istance to the path of the hurricane at least sixty miles."

Mr. Whitaker adduces a number of names of respectable parties in support of his re- arkable statement as being co-witnesses.

Such is a statement of the facts connected with the Iowa and Illinois tornado of May 2, 1873, so far as I have been able to collect them. I spared no pains in order to render t scientifically complete, sometimes traveling miles under a fierce sun, and with a emperature among the nineties, in order to obtain the evidence of one man. The nformation given by any witness by no means represents the number of questions sked him. These were extensive and calculated to extract all the knowledge on the ubject possessed by those under examination. For instance, the following question vas addressed to all and sundry: Did you observe any pointed objects, such as light- ing-rods, posts, &c., tipped with flame, during the progress of the tornado? But being niformly answered in the negative, has not been formally inserted in the statement of acts. Also, a description of the sound was exacted from all witnesses, but only a few ypical ones have been inserted. I regret this at present, because I have learned from xperience that very important questions may attach themselves to a description of he sound. While interrogating parties the utmost vigilance was exercised to prevent hem from giving conclusions for what they saw and heard. This was a very troublesome point, and caused the interrogator to appear in many cases in the highest degree ude; while it also excluded from these pages the names of persons who observed ccurately, but who are unable to distinguish between the *esse* and the *ergo*.

No opportunity was allowed to pass of obtaining information. Whether at home, on he road, or in the field, all met were questioned. Of course by far the majority could ive no information worth taking.

It will be noticed that the statement of facts for Iowa is much more exhaustive and nstructive than that for Illinois. There are several reasons for this:

1. Some weeks had already elapsed since the tornado, and its traces were becoming apidly obliterated, both in the memories of the witnesses and upon the surface of the arth.

2. It was later in the day when it occurred, thus hiding the light of the sun more

completely by the tornado-clouds as they approached, and rendering it more difficult t observe accurately their forms and proportions.

3. The storm in Illinois seems to have been of a somewhat different character fro that in Iowa, by its form rendering observation more difficult.

It may perhaps not be deemed irrelevant to mention that the best information wa uniformly obtained from those who are not natives of the localities in which they liv but have settled there from other States or other countries. The reason of this ma perhaps be that Iowa and Illinois are but recently settled, and that consequently th native-born population have not yet had time to arrive at years of discretion, wherea the original settlers are in the prime of manhood or verging toward old age.

With regard to the angles of elevation given, it must be borne in mind that they ar only approximations. Very few indeed of the witnesses have accurate conceptions angles. I generally made them point in the direction in which an object was seen, an so estimated the angle.

CALCULATIONS AND CONCLUSIONS.

The idea of a tornado in general.

The tornado consists essentially of a rapidly-ascending current of air. This involve two other functions: first, a rushing in of the air at the under part of the ascendin current or column; secondly, an outrushing at the upper. Upon the former of thes functions, combined with modifying circumstances, depends the peculiar character an career of the undercurrents and of the clouds they bear; upon the latter, combine with the same circumstances, the proportions and direction of motion of the uppe currents and of the heavy masses of clouds they bear. There appears to be nothing i the nature of the tornado itself which can determine the motion of either the upper c under current more toward any one point of the compass than toward the others. Thi direction of motion relative to the ascending column depends upon the direction an velocity of motion of the latter, and of the atmospheric strata in which the influx an efflux take place, modified, to some extent, by the differing velocities of revolution c the surface of the earth at different parallels of latitude, by the form of the earth' surface, and by the variation in the constitution of the atmosphere. If the tornad column, and the atmospheric strata which it penetrates, move in the same direction an with the same velocity, the influx and efflux will take place in nearly equal quantit on all sides of the column. If they move with different velocities the directions c exaggeration and diminution of the influx and efflux can be calculated in the same wa as the direction of a wind-vane on a ship's mast, giving the directions and velocities c the motion of the wind and of the ship.

General idea of the tornado of May 22, 1873, in Iowa.

A huge, dark cloud covered an area at least thirty miles in diameter. Under th southwest edge of this cloud there moved a perfectly opaque funnel-shaped appearance, reaching from the ground to the clouds. Toward its base, the wind, in spiral rushed violently from all sides, overthrowing, when in immediate proximity to c within the opaque vortex, whatever opposed its progress. Toward its summit, wher it disappeared in overhanging horizontal cloud, long streaks of clouds rushed i spirals from all directions. Viewed from a distance they appeared to come from opposite directions, and move swiftly toward each other at right angles to the observer' line of vision. Between the surface-current and these centripetal clouds the ai doubtless obeyed the same forces, and rushed in spirals with ever-increasing velocit toward the opaque funnel.

Under the remainder of the lofty cloud which defined the limits within which th outspreading of the ascending air was taking place, and which lay chiefly to th northeast of the rising column, there raged a tremendous storm of hail and rai accompanied by incessant and brilliant electrical phenomena.

More particular description.—Dimensions of the meteor, and of the centrifugal or upp current.

Mr. B. Whitaker, (p. 1081) when sixty miles distant, saw the summit of the dark clou in the direction of Washington, Iowa. Of this fact there can be little doubt, th time agreeing precisely. In order that its summit might barely reach the level of th rational horizon the cloud would require to have an elevation of $\sqrt{(4000)^2+(60)^2}=0.4$ mile nearly. Mr. Whitaker simply states that a dark cloud occupied the heavens i that direction. This supposes that it reached to a considerable distance above th horizon. If we suppose it only reached 15° above it an additional elevation of ove xteen miles, or a total height of between sixteen and seventeen miles, would be quired.

Mr. Whitaker's evidence as to the immense height of the cloud receives corroboraon from the evidence of a great many of the witnesses, who state that they saw the ack cloud in the west for hours before the tornado came. Since the storm traveled irty miles per hour, if the cloud was seen two hours in advance at an elevation of ° above the rational horizon, and it would scarcely have attracted attention when wer, then it must have been sixteen miles in height.

The data for determining the horizontal extent of the cloud are not very precise. here is a general concurrence of the witnesses that it reached only a few miles to e south of the tornado, and that very little rain or hail fell there. G. W. Brockway . 1072) testified that at Talleyrand, about two and a half miles southeast from the ack of the tornado, there fell neither hail nor rain, and that the cloud did not reach e zenith. Isaac Farley (p. 1071) testified that at Foote, Iowa County, fifteen miles rth of Talleyrand, there was but little rain and no hail. E. R. Eldridge (p. 1071) testied that at Washington the cloud reached a little beyond the zenith. At Lone Tree and icholl's Stations I found by personal inquiry that there was a very heavy thunderorm. These stations lie eighteen miles north-northeast of Washington. It is evient, moreover, that the cloud must have extended considerably beyond the area over hich it rained. It is probably, therefore, no exaggeration to assign thirty miles as ne diameter of the cloud from south-southwest to north-northeast.

Arthur Howell (p. 1071) testified that at Yalton, five miles north of the tornado, three ell a heavy rain of about an hour's duration. The storm traveled about thirty miles er hour. This would give the cloud an extent in the direction in which the storm raveled of more than thirty miles. There is a general agreement among the witesses that a little hail fell some few minutes before the advent of the funnel, and a ittle rain immediately after its passage. The whole appears to have occupied at least hirty minutes in passing. This would give the cloud at the funnel a width of at east fifteen miles in the line of its progress. Probably it was considerably greater. Ve may, therefore, safely conclude that we are within the limits when we assign to he centrifugal cloud an average horizontal diameter of thirty miles.

I have no data for determining the elevation of the under side of the centrifugal loud beyond what is involved in those for measuring the altitude of the centripetal. There must, however, have intervened a very considerable space between the two. For if there was nothing intervening there could be nothing to prevent the under, and specifically lighter, air from taking the shortest way up. There could be no reason why it should first rush to a center, ascend there, and then rush from it.

Dimensions of the centripetal current.

The data for determining these are still less precise than the preceding, but yet sufficiently so to give a more definite idea than any mere description in general terms.

H. C. Vittitoe (p. 1071,) saw, when three miles to the northwest of the tornado-path, white underclouds rushing to a center a little south of the zenith. A. Vandevere, whose evidence may be here adduced, although it refers to the tornado in Illinois, states: I have reliable information that two or three miles to the north the clouds were seen rushing south. The clouds came also from the south. Nearly all the witnesses who watched the approaching storm tell of clouds seen darting toward each other from opposite directions. It was impossible, however, to obtain anything like accurate measurements, owing to the distances being unknown. If we suppose that the centripetal clouds had a horizontal diameter of four miles, we may obtain a determination of elevation from the data given by E. R. Eldridge, (p. 1071.)

At four miles' distance, the point where the lower clouds seemed to join the higher appeared to him to have 35° of elevation. Deducting two miles from the distance for the assumed diameter of the centripetal clouds, we have an elevation of 1.4 miles.

J. W. Plumber (p. 1062) gives the angle subtended by the centripetal clouds when several miles distant, at about 45°, and the angle of elevation at about 35°. If we assume the distance to have been five miles, we should have over 4.6 miles as the diameter of the centripetal clouds, and 3.5 as the altitude, which latter figure is, perhaps, though not necessarily, too great.

The assumed distance of five miles refers to the base of a perpendicular from the summit of the cloud to the ground, and it is probably not too great since it corresponds to only ten minutes' motion of the storm. These clouds attracted attention by the great rapidity of their motion toward a common point; but their velocity gradually diminished from the center to their outer limits. They undoubtedly commenced the journey with a velocity by no means striking, and in much smaller and less dense masses. Hence the probability is that they extended much farther than they were observed with sufficient attention to leave an impression upon the memory. Moreover, the current in which they originated must have been in motion toward the vortex before they were formed, because they owed their existence to the circumstances connected with that motion. It is, therefore, probable from these data that in assigning ten miles as the diameter of the centripetal current at the altitude of these clouds we do not overrate it.

There is good reason for believing that the diameter of the centripetal current was not less at a considerable elevation than at the earth's surface, because of the many obstacles there opposed to its progress. Yet R. L. Harper testifies that, at Baden, three miles northwest of the storm-center, the wind changed from northeast to northwest as the storm passed. This implies that it blew at least some few minutes from a northerly direction, and also with force sufficient to attract attention. Suppose it blew 20 minutes in all from a northerly direction, we should have, since the storm was traveling thirty miles per hour, a diameter of nearly twelve miles for the surface centripetal current.

It is here necessary to the force of the reasoning to call attention to the fact that the wind, on the 22d of May, was, in accordance with the barometric gradient, southerly.

William P. Lisk (p. 1048) states that about twenty minutes before the arrival of the tornado the wind blew from the north. This would give a diameter of twenty miles, that is, assuming the northwest quadrant to be as extensive as the northeast.

M. Williams, (p. 1048,) a very careful witness, states that about twenty-five minutes after the passage of the whirlwind, the wind came again from the southwest. This also gives a diameter of twenty miles. The witnesses (see Keota evidence, &c.) generally testify that hail fell from 15 to 30 minutes before the whirlwind, and rain for as long a period after. They further, almost unanimously, say that the wind was easterly with the hail and westerly with the rain. If we assume 20 minutes as the duration of each of these winds, we again obtain twenty miles as the diameter of the inrushing winds at the earth's surface.

If the disturbing influences were not much greater at the earth's surface than at a higher altitude, the dimensions of the whirl should, within the limits of the centripetal wind, owing to the absence of friction, vastly increase as we ascend. Moreover, since the funnel was first formed at a considerable elevation, and since it touched the ground with a narrow point, and merely incidentally, as it were, since it for long distances ceased to strike the earth, and yet proceeded with undiminished energy; since, in short, both the originating and sustaining sources of its power seem to have mainly existed high in the atmosphere, we have the strongest reasons for concluding that the horizontal dimensions of the centripetal current were very much greater at its more elevated portions than at its base. It would therefore appear to be not unlikely that the diameter of the centripetal current was not greatly exceeded by that of the centrifugal.

Since writing the above I have received a communication from Frank McClintock, correspondent of the Smithsonian Institution, West Union, Iowa. He states that there was a thunder-storm in the morning and another in the afternoon; that the wind changed from the south to the west rapidly at 3.45 p. m., and that it worked back to the south before 9 p. m. This change of the wind agrees with the time at which the tornado passed Washington, Iowa, allowance being made for the interval which must elapse before the atmospheric disturbance could travel over the one hundred and twenty intervening miles. This change of the wind may, however, have been due to the thunder-storm mentioned. We are not, therefore, entitled from this solitary instance to conclude that the tornado had a radius of one hundred and twenty miles, although it renders it somewhat probable that it did.

The following is also a late communication. Capt. J. W. Stewart, of the steamboat Victory, states:

The tornado occurred opposite Buffalo, Iowa. The time was approximately about 4 p. m. The sky-light, pilot-house, and chimneys were blown overboard. The wind came in three heavy gusts, accompanied by very heavy rain, in fact, almost a water-spout, and the darkness was intense. The duration was not more than five or seven minutes.

The dimensions of the funnel.

The height and size of the opaque funnel varied, as seen by the eye of an observer. At times it barely touched the ground with a narrow point, at others it stood on a broader base, while for long distances it ceased to touch the ground altogether. The clouds into which its summit disappeared, appear not always to have preserved the same elevation. These changes, however great they may have seemed to the eye-witnesses, are yet in themselves insignificant when we realize that this funnel-shaped phenomenon was the base of an ever-widening column ten to fifteen miles high.

The data for calculating the dimensions of the visible portion of the funnel are more numerous than precisely accurate. In criticising them, it is to be remembered that the apparent height depended not merely upon the distance, but also upon the fact that on account of the inclination of its sides a greater portion of the funnel was seen by observers at the distance of a mile or two than by those nearer.

To Mr. R. L. Jay, the funnel when three miles distant appeared to be about one-fourth mile high.

M. Williams (p. 1048) states that when the funnel struck the ground the fences for 60 yards were carried away. It does not appear probable, however, that the base of the funnel was 60 yards wide at this point. But suppose we assume that it was, and also assume that the width of the summit was five times that of the base, which his description warrants. When at the distance of 300 yards the angle of elevation was supposed to be about 75°. From these data the distance of the witness from the base of a perpendicular from the edge of the summit would be 180 yards. This gives an elevation of 672 yards.

Sam Brunt testifies (p. 1049) that the breadth of the funnel, when on his farm, appeared to be about 100 feet.

Wm Davis (p. 1050) places the angle of elevation at 15° when half a mile distant. This gives an elevation of 235 yards.

Fred. Tollman (p. 1050) at 70 yards distance estimated the angle of elevation of the summit of the lower funnel at 60°. This gives an elevation of 121 yards.

Matthias Gengler (p. 1052) from an elevation of 200 feet and a distance of one mile estimated the angle at 55°. This gives an elevation of 2,580 yards.

Matthias Hotel (p. 1053) viewing it from the same distance and direction, but from a lower level, gave the angle at from 55° to 60°. This may be regarded as identical with the last.

Eli Walker (p. 1053) gave 30° at the distance of one and a half miles. Hence we have an elevation of 1,524 yards.

E. Stout (p. 1053) one and a half miles, 15°, and elevation of 707 yards. This refers only to the lower funnel.

Rev. J. P. Coffman (p. 1060) one mile, 25°, and elevation 821 yards.

F. Brown (p. 1061) one and a half miles, 15°, and elevation 707 yards. Mr. Brown estimated the breadth of the top at five times that of the base.

J. W. Plumber, (p. 1062,) three-fourths mile, 25°, and elevation 615 yards.

John Maughlin, (p. 1062,) 200 yards, 15°, and elevation 54 yards.

R. M. Stevenson, (p. 1063,) 700 yards, 35°, and elevation 490 yards.

The smallest of the results is 53 yards, and it may be safely discounted, because, at the distance of 200 yards, the darkness was great and the wind very strong. The time for observation also in such a position, with the storm directly approaching, was brief. The most reliable results are those obtained from observations taken on the south side of the storm-path, and at a distance of at least a mile from it. There the base-line could be accurately determined, and ample opportunity was had for calm observation. I therefore value the data on the subject of elevation afforded by Matthias Gengler and Matthias Hotel above all others. Their elevated positions gave them a splendid opportunity of watching the magnificent spectacle. The tornado was moving steadily along North Skunk River, without jumping up and down and skipping from side to side. Eli Walker and E. Stout, while occupying a position otherwise good, could not so well determine the distance of the meteor, because it was approaching them. Besides, the figures of E. Stout refer only to the lower funnel. These four witnesses watched the meteor at the same time. I therefore conclude that the tornado column was, from a favorable position, visible at some parts of its course to a height of between one and two miles.

In this connection it should be remembered that the data furnished by E. R. Eldridge (p. 1071) gave an elevation of one and a fourth miles to the cloud which he saw bending forward, but did not recognize as funnel-shaped.

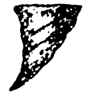
Wherever there was evidence of the funnel having touched the ground there was, to a greater or less breadth, what I have designated as the vortex of extreme violence, varying from 100 yards in breadth to nothing. Without having positive evidence, and notwithstanding that there was everywhere a gradual diminution of violence from the center to the circumference except in the remarkable phenomenon of streaks or arms, and no abrupt transitions, I could not help concluding that the path of greatest violence was identical, or nearly so, with the diameter of the base of the funnel when it touched the ground. This would give it an average diameter of about 30 yards. The witnesses are generally agreed that the summit was several times wider than the base. The exceptional case in which two funnels are superimposed will hereafter be treated. If we assume that the visible top was five times the diameter of the base, we have, say for the altitude of one mile, a diameter of only 150 yards. I think, however, that, owing to its great elevation and the optical delusion connected therewith, and the general belief of the spectators, the funnel was, at the very utmost, only a few hundred feet high; the diameter of the summit was very much greater.

The changes seen in the funnel.

Some observers saw only one funnel; others saw two funnels superimposed, with the narrow ends together, and the smaller one beneath; while a good many saw two and even three funnels, side by side. The evidence on all these points is beyond question. At first I was inclined to believe that two or more funnels had actually touched the ground and traveled side by side. The sketch of the storm by R. F. Cambell seemed to favor this explanation. It shows a protuberance on each side of the funnel, which looks like an inceptive funnel. The fact that a second funnel should travel along on the southeast side of the main one without disturbing the symmetry of the action of the latter, as exhibited by the ruins, did not appear altogether incredible, for it is abundantly evident from the statement of facts that the damage was done by a wind blowing in the path of the tornado when the black funnel hovered above or slightly touched the ground. Thus an incipient funnel, moving along the southeast side of the main funnel, and occasionally making a dip, would produce no appreciable discord in the disposition of the ruins. An insuperable objection to this theory was found in the unanimous testimony of the eye-witnesses that the funnels approached each other and combined to form one. Another objection was found in the lack of unity thus introduced into the conception of the magnificent whole. Finding this explanation untenable, I endeavored to think the possibility of smaller auxiliary funnels, each of them a perfect whirl, moving in spirals nearly or altogether identical with those pursued by the confluent winds. This I found to be more difficult than the first. The chief objection was the total lack of a conceivable cause of the existence of these smaller whirls. The second was the peculiar circumstance that while one observer saw two funnels, another in the same position saw only one, or saw two superimposed with the smaller ends together. No possible arrangement of two independent funnels with the smaller ends down could produce the optical illusion of two funnels superimposed, with the smaller ends together. I found what I believe to be the key to the difficulty while considering Mr. Marbourg's delineation of the two funnels joining in one funnel, (p. 1065.) The other observers who saw two or more funnels evidently had the whole of their attention confined to these, and did not observe what was above them. He saw the two combine at what he estimated an altitude of fifty feet and form one. Another witness, at the same place and time, saw only one funnel. At Lancaster, some saw only one, others saw two superimposed, and others saw two side by side, and all at the same time. There was, therefore, an unavoidable necessity for some explanation which could reconcile these antagonistic appearances.

Explanation.

There is excellent evidence to show that the funnel moved at its base with a sort of pendulum motion; that it seemed to stand still for a moment and then to bound suddenly forward. The evidence on this point is so general that we need not recapitulate it. But we have no reason for supposing that this oscillating motion extended to any considerable distance above the ground, for it is only in the want of homogeneity of the atmosphere and the resistance opposed to the free course of the winds by the earth's surface, that we can find a cause for this pendulum motion. Let us suppose that the funnel is over a well-watered and well-wooded ravine, with its path at right angles to it. It is evident that the air at some distance above the ground will offer much less resistance to the forces drawing it into new paths than that on the surface, where the friction is so important an element. In the forward march of the tornado the base would thus be somewhat left behind. The warm, moist air of the ravine would increase this tendency, on account of its specific levity. The funnel would become bent thus:



But the inrushing winds follow the path of least resistance toward the area of greatest rarefraction. The bending, therefore, cannot proceed far, before the southwest winds, whose direction of motion is carrying them away from the base of the inclined funnel, will find less resistance and a shorter path toward the greatest rarefaction, by striking up into the nearest point in the side of the funnel.

A streak of rarefaction great enough to produce condensation is thus generated. This arm of the funnel, affording the shortest way for the winds, will increase with rapidity. The other will decrease, becoming mainly confined to the northwest winds. Meanwhile the intervening air will become rarefied and set in motion; the two arms will suddenly unite, and the funnel present again its original proportions. These transformations must take place within a brief space of time, for the tornado is traveling at the rate of half a mile per minute. When we consider, in addition, the darkness, we will be at no loss to conceive why these two branches should present the appearance of one funnel with its smaller end down, and why, to a less favorably situated or more superficial observer, the whole should appear as one.

One difficulty yet remains to be obviated. Since the arm moves forward in a spiral to the center, and the velocity of the inrushing winds at the funnel far exceeds one hundred miles per hour, how is it possible for the observer, in the darkness, to notice the appearances distinctly? Mr. Marbourg gives the distance between the two arms at 200 feet. This space would be traversed in one second by winds of so great velocity, and the condensed vapor would fill the whole space before it had time to disappear. The very velocity itself would render distinct vision difficult. We must not, in short, confound the path of the winds with the winds themselves. While the winds were rushing up in a slanting and curving direction along these arms, the arms themselves might be moving forward with a much less rapid motion. If it were possible to determine the inclination of these arms to the perpendicular it would aid in calculating the force of the wind. Mr. Marbourg stated that the distance between the bases of the two arms was 200 feet, and the height, when they joined together, 50 feet. He gave 80 to 100 feet, however, as the height, to the editor of the Washington County Press. His own delineation favors the belief that the height was greater than 50 feet. He could easily judge of the distance between the arms, but was very liable to be mistaken in estimating the height. The error, therefore, will probably not be great if we assume that the funnels joined together at the height of 100 feet. This would give these arms an inclination of 45°.

The direction in, and the velocity with which the tornado traveled.

From its starting-point on South Skunk River until it reached North Skunk River, a distance of ten miles, the tornado traveled in an east-northeast direction. It then turned a little south of east and followed the course of that river for two miles. It then went east-northeast until it came to Rock Creek, when it turned a little west of north and followed the course of the creek for a short distance. It then traveled northeast until it ceased to touch the ground three miles from Keota. After lifting itself from the ground it traveled about east-northeast, striking again at Westchester, Washington County. From this point until it reached Enoch Wright's, a distance of over nine miles, its course was nearly straight, varying between northeast and east-northeast. Its course then became very crooked, bending in curves from northeast to southeast, and *vice versa;* but on the whole traveling east until it came within a mile of the confines of Washington County, when it made a decided turn to the southeast. Here its path lay down the declivity toward the well-wooded ravine of Goose Creek. When within half a mile of the creek its traces became so feeble that it was impossible to track it farther. It was at this point, within one and a half miles of Iowa River, the course of which is here nearly parallel with that of the tornado. The crookedness of its path reached its maximum within the last half mile of its career, before ceasing to touch the ground, as a black funnel at A. Davidson's farm, Highland Township. Within this half mile it bent first a little to the southeast, then to the northeast, then to the southeast, and again back to the northeast, when it disappeared.

After leaving Crooked Creek, at the commencement of its career in Washington County, and until it reached to near Goose Creek, the tornado traversed an elevated, well cultivated region, almost totally devoid of trees and water-courses. There was apparently nothing in the configuration of the ground over which it passed which could account for its changes of direction. These changes, moreover, were not generally abrupt, the tornado sweeping in graceful curves from one direction to another. It is to be noted, however, that the curving of its path commenced after it came within the influence of the moister, warmer air of the Iowa River, and that the general deviation of its course from the northeast direction, which it had on the whole hitherto followed, led it down the valley of the Iowa River.

In order to determine the velocity with which the meteor traveled, it was necessary to obtain the precise time of its arrival at different points. The difficulty of obtaining precise time in an agricultural district is always considerable. In addition, no one thought of looking at his clock or watch; hence, although every witness was questioned on this point, there were but few who could even approximate to the time. The majority thought that they had a remarkably definite idea when they could tell between what hours it occurred. Reliable time, it is believed, was obtained at least at two places in Iowa, at Wolfden school-house, Lancaster Township, Keokuk County, and at A. McKee's house, section 23, Cedar Township, Washington County. The times obtained at these places were corroborated by the testimony of those likely to be best informed. The tornado struck the school at 2.15 p. m.; it arrived in section 23, Cedar Township, at 3.10 p. m. The distance between these places in a straight line is twenty-seven miles. This gives a velocity of 29.4 miles per hour. The crookedness of its course, though not great, would bring its velocity along its path to thirty miles per hour at least.

The direction of the centripetal winds.

The wind blew in spirals toward the center of the vortex, the direction of revolution being contrary to the hands of a watch throughout the whole course of the storm. The evidence in support of this, as given in the statement of facts, is overwhelming, and recapitulation unnecessary. The mere fact that all who had an opportunity of seeing the funnel saw that it was circular is sufficient to prove that it was a whirlwind, for on no other hypothesis could the circular form be accounted for. Then the witnesses, almost without exception, saw this funnel whirling contrary to the hands of a watch. Then the illustration of the position of the ruins of the houses and of the fallen trees, &c., proves beyond a doubt that a merely centripetal wind could not have done these things. Again, that the wind was not blowing in circles round the center is sufficiently demonstrated by the fact that everything, except within the most violent vortex, was thrown toward the center. The ruins invariably lay most thickly there. The only form of motion capable of producing these effects is a mean between the circular and the direct centripetal, to wit, the spiral. The illustrations give copious ocular demonstration that such was the case. The ruins of houses, whenever they could be distinctly traced, proceeded in a curve toward the center, which apparently was always reached before the completion of an entire revolution. This does not imply that the centripetal winds never performed a complete revolution before reaching the center, but only that from within about 100 yards of the center this did not take place. Ruins carried from that distance seemed generally to reach the center in about two-thirds of a revolution. This led me to assume that at about 100 yards from the center the wind generally made an angle of about 25° with the tangent. This gives a centripetal component compared with the circular as .42262 is to .90631.

Besides its horizontal motion, the wind had necessarily an ascending motion, which reached its maximum at the center and its minimum at the circumference. The necessity for this lies in the proof of the centripetal motion of the wind; otherwise the centripetal motion of the wind would require to double itself at half the radius from any point toward the center. This would soon give it a motion infinitely great, which is absurd. There would also be no means of escape for it at the center. We have, besides, ocular demonstration. To a great many excellent witnesses the funnel presented the appearance of a screw with its thread running upwards. In addition, all objects within the sphere of the tornado seem to have been partly lifted, partly pushed forward. We have seen that at A. Gibson's house the arms made an angle with the perpendicular of probably about 45°. Since these arms, as there is every reason to believe, were inclined in the normal direction of the winds, which is that of least resistance, we are justified in assuming that in the black funnel itself the inclination of the winds to the horizon was at least as great, and probably greater.

The velocity of the wind.

This is a very difficult topic. The task would have been much easier if we had been dealing with a horizontal wind merely. If even the perpendicular and horizontal components were invariable, the hope of a tolerably accurate solution of the problem would be much greater; but while the former decreases from the center to the circumference, the latter increases. Neither is it possible to do more than approximate to the relative strength of these components at any point. In order that no chance of a solution might be lost, I collected the following heterogeneous data:

1. A school-house, weighing 30,000 pounds, was pushed 25 feet from its foundations. The surface exposed to the wind = 360 square feet + the roof, which had a slant of 45°, (p. 1049.)
2. A beam, 14 feet by 2 by 4 inches, weighing 25 pounds, was carried 35 yards, and driven into black mold 3 feet 9 inches, at an angle of 35°, (p. 1050.)
3. An iron sausage-machine, 6 by 8 inches greatest exposure of surface, and weighing 15 pounds, was carried away, (p. 1054.)
4. An oak tree, 3 inches in diameter, was perforated by a board 6 by 1 inches and (probably) 8 feet in length, (p. 1057.)
5. A hog, weighing 400 pounds, was carried a mile and a quarter. A cow and horse were carried 400 yards, (p. 1058.)
6. A horse-power machine, weighing 2,400 pounds, and exposing a surface of 2 square feet, was pushed forward 6 yards, (p. 1058.)
7. A post, 8 feet long and 4 inches in diameter, and which had been driven 3½ feet into the soil, was pulled out by the wind , (p. 1059.)
8. An elm fence-board, 8 feet by 6 by 1 inches, was driven into the soil 4 feet, at an angle of 45°, (p. 1060.)
9. A door, exposing a surface of 18 square feet, was held by four men against the wind, (p. 1063.)
10. A house, exposing 280 square feet to the wind, having a floor of 480 square feet, and weighing 20 tons, was pushed 6 feet from its foundations. It was then lifted over the tops of trees 20 feet high, (p. 1063.)
11. A heifer weighing 700 pounds was carried away, (p. 1063.)
12. A house presenting to the wind a surface of 176 square feet without the roof, and weighing 10 tons, was carried 24 yards while falling 3 feet, (p. 1064.) The wind struck it nearly on the end.
13. An oak sill, 16 feet by 8½ inches, and weighing 300 pounds, was driven 4 feet into

ck loam at an angle of 45°. It was carried 25 yards northeast with the house, and
yards east after parting from the house, (p. 1064.)

4. A granary, exposing 128 square feet of surface, and weighing 60,000 pounds, was
shed 14 feet, (p. 1064.)

5. A plank 16 feet by 1 foot by 2 inches, was driven 4 feet into the soil at an
gle of 45°, (p. 1064.)

6. A corn-sheller, weighing 640 pounds, was carried 400 yards, (p. 1064.)

7. An oak board, 4½ feet, 4 by 1 inches, was driven through an oak post 4 inches in
meter, (p. 1066.)

18. A house, exposing a surface of 392 square feet, + the slanting roof, and weigh-
20 tons, was carried forward 18 feet while falling 2 feet, (p. 1066.)

19. A house, exposing 533 square feet, and weighing about 25 tons, was pushed from
foundations, (p. 1068.)

20. A beam 14 feet by 6 by 2½ inches was driven 3 feet into the soil in a slanting di-
tion. Its weight was 50 pounds, (p. 1066.)

21. A stove, exposing a surface of 3 feet by 21 inches, was pushed 12 feet, (p. 1068.)

22. A granary, exposing a surface of 256 square feet to the wind, and weighing
,000 pounds, was carried 21 yards while falling 6 feet, (p. 1068.)

23. A bell, exposing a surface of 1 square foot, weighing 115 pounds, and suspended
feet high, was carried 60 feet, (p. 1068.)

24. A hog weighing 200 pounds was carried 500 yards, (p. 1068.)

25. A green log of water-elm, 8 feet long by 7 feet in circumference, and weighing
000 pounds, was carried 50 yards, (p. 1069.)

26. A horse, weighing 1,080 pounds, was carried 45 yards, (p. 1069.)

It will be better to treat all similar examples together, and first let us examine the
ta concerning the houses.

If we estimate the static friction of a frame house upon a stone foundation or upon
sts firmly fixed into the ground, and to which it is nailed, at one-half the weight of
e house, it does not seem likely that we shall err by excess. Upon this basis it is
sy to calculate the minimum velocity of a horizontal wind necessary to push it from
s foundations. The difficulty is that we are dealing with a wind having a perpen-
cular component to its velocity. If the wall of the house was perfectly smooth, and
nce the air is nearly perfectly elastic, the only force exerted upon it by a wind blow-
g at any angle to its surface would be perpendicular to that surface. Moreover,
hatever force the perpendicular component may exercise upon the wall, owing to its
ughness, must have upon the house the effect of an overturning rather than a lift-
g power. But, since friction is independent of extent of surface, this overturning
ower would not assist in overcoming friction. The fact, also, that the houses, while
eing carried bodily through the air, were not made to spin round on an axis by this
erpendicular component, there being then no resistance, beyond inertion, to motion in
circle, would seem to prove that its effect was not great. It would, therefore, appear
hat an approximation may be made to the velocity of the horizontal wind by simply
alculating upon the given assumption of the relation of weight to friction the min-
mum force required to push these houses from their foundations. The following are the
esults for the given cases:

1. Pressure per square foot 41.7 pounds. Velocity of wind 91.3 miles per hour.
10. Pressure 71.4 pounds. Velocity 119.5 miles.
12. Pressure 56.8 pounds. Velocity 106.6 miles.
14. Pressure 234.3 pounds. Velocity 216.5 miles.
18. Pressure 51 pounds. Velocity 100.9 miles.
19. Pressure 46.9 pounds. Velocity 96.8 miles.
22. Pressure 107.4 pounds. Velocity 146.6 miles.

The roofs in these calculations have been neglected when the wind struck the side
f the house, because if the wind was ascending at an angle of 45° it would not
trike the roof at all, and even a much less angle of inclination would produce a com-
aratively small effect; for if the wind were blowing horizontally 70 per cent. of its
otal force would be exerted perpendicularly to the roof. This 70 per cent. would be
esolved into two components of 70 per cent. each, or of 49 per cent. of the force of the
vind, one of which would add to the weight of the house and consequently increase
he friction by one-half its amount, while the other would aid in overcoming the
riction. Thus, even in the case of a horizontal wind exerted upon a roof sloping at
5°, only 24½ per cent. of its total amount is effective to aid in overcoming friction;
hat is, neglecting the friction of the wind against the roof.

Only one of these buildings was not, in addition to being pushed from its foundation,
arried away, viz, case 14. It, however, was pushed through a dense mass of tough
ubbish, and its sides were bent from the perpendicular. Owing to its small surface
nd great weight the force of the wind exceeded the minimum required to push the
uilding from its foundations less in this case than in any of the others. Hence we
ave the great velocity of 216.4 miles per hour, or of 317.4 feet per second, in a horizon-

tal direction. It is also probable that in this case the kinetic friction was greater than the static, and that it increased every moment until the building came to a stand.

In the case of the other houses the maximum velocity of the wind was by no means necessary to push them from their foundations. They were in addition shot forward as if from a cannon, without touching the ground while almost grazing it, and at the same time maintaining their normal position. We have the testimony of one eye-witness that the house went like the railroad; of another that it went like lightning. Since the house in the former case only traveled 40 yards, (p. 1063,) and in the latter only 24 yards, the above expressions would appear to justify the assumption that the acceleration of the houses could not have been less than that produced by gravity, or 32 feet per second. This would require a force double of that necessary to overcome friction on the assumed basis. This gives in case 12 a pressure of 113.6 pounds, or a velocity of 150.7 miles per hour.

There is yet another way of calculating the velocity of the wind from these houses. We have seen that in several cases they went forward in a well-nigh normal position, close to the ground, and falling as they went.

The perpendicular component of the wind's force exerted upon the side of the building should, we have seen, if effective, tend to make the building revolve, and so throw it out of its normal position. Since this did not take place we assume that the force was not effective. If, therefore, we find by comparison of the force required to impart motion to a body sufficient to enable it to travel over the horizontal distances given, while the force of gravity is drawing it through the perpendicular spaces given, that it is unreasonably great, we shall have good grounds for concluding that there was somehow a lifting power exerted other than that due to the perpendicular component of the force of the wind.

Let us examine case 12. The house falls 3 feet while traveling 24 yards. In the time during which it traveled, therefore, the motion of the house due to the force of the wind was 24 yards or 72 feet, while that due to the force of gravity amounted only to 3 feet; that is, the acceleration caused by the wind was 24 times greater than that caused by gravity. Now the force is as the square of the acceleration. Hence, if no lifting power had been exerted, the force of the wind must have been 576 times that of gravity. This gives a total pressure upon the side of the house of 5,760 tons, or 32.7 tons to the square foot, which is absurd, for the force generated by a difference of pressure cannot exceed that generated by a difference of a whole atmosphere, and that amounts only to about 3,350 pounds per square foot. We are, therefore, irresistibly drawn to the conclusion that the houses, while being driven forward, were partially supported by the wind. We may learn how this was accomplished by studying case 10. The house was first pushed from its foundation for 6 feet, then turned upon its edge, and afterward lifted over the tops of trees 20 feet high. Probably the trees were so bent as to allow the house to ascend at an angle of 45°, thus reducing the height to be ascended to about 16 feet. The problem is how to apply a wind in order to generate the force required. We have the evidence of L. W. Low, (p. 1050,) that as soon as his house turned up on its edge, the flooring flew to the roof. This is probably the usual procedure in similar cases, and its cause is this: as soon as the edge of the house is lifted the wind rushes in, and finding its further progress barred, becomes instantly compressed by the wind in rear. It thus exerts over the whole interior of the house a pressure nearly equal to that exerted upon one side of it by the wind. If the house is a weak one the immediate result is that it is burst asunder. If it is a strong one, as it evidently was in this case, the compressed air, acting on the one side on the ground, and on the other side on the inside of the house will, if the compression is sufficiently great, lift the house. The area of the floor of the house in question was 480 square feet, and its weight was twenty tons. The pressure per square foot exerted perpendicularly to the area of the floor, required, in order to lift the house, was therefore 83.3 pounds. But the force actually exerted did not alone suffice to lift the building. It must have raised it in a very brief period to a height of 16 feet; for the action of the wind urging it forward was yet in full operation. If we suppose that it occupied one second in ascending these 16 feet, the lifting power exerted must have been double that of gravitation, or 166.7 pounds per square foot. Moreover, by the hypothesis, the force in these calculations has to be applied perpendicularly to the base. But actually it was not, the house being tilted up on its edge. Some of the power of the wind would also be lost by escaping through openings. Further, as soon as the house was lifted from the ground the resistance to the wind, and therefore its compression in the interior of the house, would be in a great measure removed. A pressure of 200 pounds per square foot would appear, therefore, inadequate to accomplish the work; that is, a pressure of the wind, or a velocity of two hundred miles per hour.

It is readily perceived that a body which is being accelerated by the wind will, if it partially presents its under surface to it, have the action of gravity upon it counteracted according to the extent of the surface exposed, &c. Such, I conceive, was the manner in which the houses, while traveling forward, were in the main partly relieved of the effects of gravity.

The extreme difficulty of obtaining even an approximation to the velocity of the ind is very appreciable in these calculations. In my opinion the best case is that of 4, because of its remaining firmly on the ground. The total weight of itself and connts was also easily obtained. I therefore conclude that since the wind in this case ad a velocity exceeding two hundred and sixteen miles per hour, that it had a vecity equally great over a large portion of its path, and at particular points somemes greater.

A horse or a cow of 1,000 pounds weight does not probably expose a greater surface the wind than 12 square feet. Many cows and some horses of this weight were cared long distances. The lifting force of the wind, therefore, must in these cases have xceeded 1,000 ÷ 12 = 83.3 pounds per square foot, and its velocity 129.8 miles per our perpendicularly.

21. A stove weighing 450 pounds and exposing 7½ square feet of surface was pushed 2 feet. Estimating static friction at one-half the weight the pressure must have been 0.7 pounds per square foot, and the velocity 78.3 miles horizontally.

25. A log of water-elm, exposing a surface of 17.8 square feet and weighing 2,000 ounds, was carried 50 yards. It was probably barely lifted from the ground, if it as carried, because it did not strike deeply into the soil when it stopped. Its path ould not be traced by marks left on the ground. The lifting power of the wind, in rder just to balance gravity, must have been 112.3 pounds per square foot, representg a perpendicular velocity of 149.8 miles. It may be asked how a perpendicular ind was possible close to the ground. The answer in regard to the log is that the orizontal wind would become compressed between the bulge of the tree and the round. In that case, however, the surface exposed is not so large. The whole bears mple evidence of a terrific but incalculable wind.

3. An iron sausage-machine, exposing a surface of 48 square inches, and weighing 15 ounds, was carried away. The lifting power must have exceeded 45 pounds per quare foot, which corresponds to a perpendicular component of 94.8 miles.

6. A horse-power machine, exposing a surface of 2 square feet, and weighing 2,400 ounds, was pushed along the ground for 6 yards. The machine lay close upon the round, allowing very little scope for lifting power. The static friction could not ave been less than one-fourth the weight. Allowing one-fourth the weight of the achine for the lifting component of the wind, which is undoubtedly an exaggeration, here still remains a pressure of 225 pounds per square foot, horizontally, or a velocity f two hundred and twelve miles per hour.

2. A beam, exposing a surface of 7 square feet, and weighing 25 pounds, was driven nto the ground 3 feet 9 inches, at an angle of 35°. The area of the end of the beam was 8 square inches. A columbiad 10-inch shell, when filled, weighs about 100 pounds. At he distance of 100 yards such a shell penetrated compact earth 33 inches. Its velocity t the time of impact would be about 1,200 feet per second. The earth into which the eam was driven was black mold, which had never, beyond the depth of a few inches, een disturbed by the plow. It was wet at the time. If we estimate its resistance at alf that of compact earth it is not likely we shall overrate it. The columbiad shell n these premises would have penetrated the mold 66 inches. The area of a great ircle of the ball is 78.54 inches. The weight, therefore, for the square inch of resisting surface amounts to 100 ÷ 78.54 = 1.27 pounds. The weight of the beam per square nch of its end is 25 ÷ 8 = 3.1 pounds. We have, therefore, the following equation:

$$\frac{1.27 \times 45 \times (1200)^2}{3.1 \times 66} = X^2$$

when X is the velocity of the beam in feet per second, = 634 feet. This gives the beam a velocity of 432.3 miles per hour, which is evidently erroneous, for it was accelerated to this enormous velocity within a space of 35 yards. Gravity acting through this distance could only have produced a velocity of 82 feet. Since the force is as the square of the velocity, the following equation gives the force of the wind upon the beam:

$$\frac{(775)^2 \times 25}{(82)^2} = \text{force} = 2{,}233 \text{ pounds pressure.}$$

Since the surface upon which this force was exerted did not exceed 0.7 square foot, the above pressure has to be increased by one-fourth its amount in order to obtain the pressure per square foot. The result is therefore evidently very erroneons.

Calculations from similar data give like stupendous results. Perhaps, however, the apparently prodigious velocities imparted to these flying timbers may point to the fact that at some elevation above the ground the velocity of the wind was vastly greater than at the surface. It may be also that the timbers were carried to a great elevation, and thus owed a large part of their rapidity of motion to gravity. There is also much uncertainty concerning the resistance of soils. I shall, therefore, leave the remaining data uncalculated, as involving too many unknown quantities.

The amount of the precipitation.

It was impossible to obtain more than generalities on this head. There were no rain-gauge measurements so far as I could learn. At Davenport, however, a few miles from where damage was done on the Mississippi, there fell, on May 22, 1.35 inches, as shown by the signal-service reports. From the description of the rain to the north of the funnel, in Washington County, a greater quantity than this must have fallen at many places. It is not, therefore, likely that we shall overestimate the amount when we assume that two inches of rain fell over an area ten miles in width. Since the tornado traveled thirty miles per hour, this gives a rain-fall per minute of $\frac{2\times(10\times\frac{1}{2})\times3097600\times9\times144}{1728}=$ 23,232,000 cubic feet.

Tornado dynamics.

A cubic foot of water weighs 1,000 ounces. The weight of water which fell per minute was, therefore, $\frac{23232000\times1000}{16}=1{,}452{,}000{,}000$ pounds. It is not, probably, an exaggeration to assume that this mass of water fell on an average 6 miles or more. This gives a horse-power of $\frac{1452000000\times(6\times5280)}{33000}=1{,}393{,}920{,}000$ generated by the falling water.

From the calculations of the velocity of the wind, it is not probable that, when we assume, at the distance of 100 yards from the center, an average velocity of 120 miles per hour, we overrate it. The angle (p. 1088) which the wind made with the tangent was probably about 25°. The wind, therefore, on these bases, enters a cylinder of 100 yards radius at the rate of 50 miles per hour or 4,400 feet per minute.

From the calculations of the height of the centripetal current, we have seen that it probably extended over two miles. Let us assume that its height was two miles. Let us assume also that the velocity with which the wind entered the cylinder was equally great throughout its length. We have then the following data for calculating the quantity of air which enters this cylinder of 100 yards radius, or 628.318 yards circumference per minute. It amounts to $(628.318\times3)\times4{,}400\times(2\times1{,}760\times3)$ cubic feet $=$ 87,582,502,656,000 cubic feet. Since this volume is calculated from the mechanical effects or force of the wind, and since the relation between the force and the velocity of the wind is calculated for the average pressure, it matters not in calculating the mass of the above volume of air what the barometric pressure was at the distance of 100 yards from the center. The difference of pressure due to elevation must, however, be calculated. Since the average pressure at sea-level is about thirty inches, at an elevation of one mile about 24.60 inches, and an elevation of two miles about 20.20 inches, and taking into account the correction due to the elevation of the country over which the tornado passed, 24 inches would be about the mean pressure up to two miles of elevation. The density of the air varies with the temperature. From the data given on page 1093, the temperature around the tornado must have been, at a fair exposure, about 76°, but was in deep-wooded ravines no doubt much greater. Since the temperature diminishes 1° for every 300 or 400 feet of elevation, we may assume the average temperature to have been within the limits of the centripetal current about 60°. The relative humidity (p. 1072) was about 65 per cent.

The weight of a cubic foot of air, at a pressure of 24 inches, a temperature of 60°, and a relative humidity of 65 per cent., is 426 grs., or thereabout. The total weight of air, therefore, entering the column per minute amounts to $\frac{87582502656000\times426}{7000}=5{,}330{,}$-020,875,922 pounds. This weight of air moves by hypothesis at the rate of one hundred and twenty miles per hour, or of 170 feet per second. This velocity is acquired from the acceleration due to gravity in falling through a space of 481 feet. The power, therefore, generated by this mass of air moving with the given velocity amounts to $\frac{5330020875922\times481}{33000}=77{,}689{,}092{,}161{,}166$ horse-power.

The latent heat of evaporation amounts to about 1,000°. Consequently the condensation of 1,452,000,000 pounds of vapor is accompanied by the evolution of $1{,}452{,}000{,}000\times1{,}000$ calorics or pound-degrees of heat. The specific thermal capacity of air, as compared with water, is as .237 to 1. The number of degrees, therefore, which this amount of heat would raise 1 pound of air, is $1{,}452{,}000{,}000{,}000\times\frac{1000}{237}=$ 6,126,582,278,481 degrees. But the pressure remaining the same, air expands $\frac{1}{491}$ part of its volume for every accretion of 1 degree of temperature. This amount of heat would, therefore, expand 1 pound of air, $6{,}126{,}582{,}278{,}481\div491=12{,}477{,}764{,}315$ times. A cubic foot of air at 30 inches pressure, 60° temperature, and having a relative humidity of 65 per cent., weighs 538.6 grains. A pound of such air, therefore, occupies $7{,}000\div538.6=12.99$ cubic feet $=$ or very nearly 13 cubic feet. A pound of air, therefore, in doubling its volume must, the pressure remaining 15 pounds per square inch, raise a weight of $13 \times 144 \times 15 = 28{,}080$ pounds through 1 foot. The total amount of work, therefore, performed by one pound of air, while expanding under a pressure of 15 pounds per square inch to 12,477,764,315 times its original bulk, is $12{,}477{,}764{,}315 \times 28{,}080$ foot-pounds. This amount of work accomplished per minute demands $\frac{12477764315 \times 28080}{33000} = 10{,}617{,}443{,}089.8$ horse-power.

We thus see that the power generated by the condensation of the amount of vapor estimated as having been precipitated is much less than that calculated to have been produced by the velocity of the centripetal winds. Theoretically this power should be diminished by the amount of expansion counteracted by the removal of so large a mass of vapor. Practically, however, it seems probable that this removal of vapor, while increasing the specific gravity of the air, yet when taking place with great rapidity serves rather to increase the rarefaction.

The horse-power required to raise 5,330,020,875,922 pounds to a height of five miles per minute amounts to $\frac{5330020875922 \times 5 \times 1760 \times 3}{33000} = 4{,}264{,}016{,}700{,}737.6$ horse-power.

These figures convey a better idea of the tremendous power of the tornado than any mere verbal description could do. They also show that the power evolved by the condensation of vapor, while enormous, is by no means sufficient to supply the whole energy developed by the tornado. We must therefore look for another source of power. This is no doubt to be found in the destruction of the atmospheric equilibrium by an abnormally-warm southerly current flowing under a much colder and consequently specifically heavier stratum of air. This brings us to the consideration of the general atmospheric conditions under which the tornado originated.

General atmospheric conditions.

An area of low barometer existed in the Mississippi and Missouri Valleys on the 20th, 21st, and 22d of May, which moved very slowly northward. This induced a southerly current, abnormally warm for the season, over a large portion of the interior of the continent. The result was a series of violent local storms, or spasmodic atmospheric convulsions, along the whole southern declivity of low barometer. These storms were generally accompanied by hail, and always by lightning. They reached a climax in the tornado, which is the subject of this paper, and in that which simultaneously devastated a portion of Kansas. The circumstances under which these terrible meteors arise are, therefore, easy of comprehension. They are the same as those which produce the beneficent thunder-shower, only they exist in greater intensity. The warm southern current, drawn toward the center of low barometer, passes under much colder and heavier air. So long as the greater specific gravity of a given volume of the upper stratum of air, which is due to a lower temperature, is balanced in the lower stratum by the greater density, consequent upon greater pressure of the same volume of air, so long may the atmosphere remain in a state of unstable equilibrum. Any disturbing cause may, however, destroy this state of unstable equilibrum, because the moment the pressure upon the underlying warm air becomes equal to that upon the upper stratum, it becomes the less dense, and, therefore, specifically lighter. Consequently, as soon as an opening is broken through the upper strata, the state of unstable equilibrium is immediately destroyed, and a powerful ascending current formed. It is manifest that the state of unstable equilibrium may continue until the density arising from the lower temperature exceeds that arising from the greater pressure. The moment this occurs, the unstable equilibrium is destroyed. The nearer the atmosphere approaches to this condition, the more intense will be the consequent convulsion. It seems probable that in the case of tornadoes this total destruction of equilibrium is a frequent, if not a constant, accompaniment.

The electrical phenomena.

On this subject there is a general harmony among the witnesses. In the lofty centrifugal cloud there was incessant thunder and lightning; but very little, if any at all, in the centripetal cloud and the funnel. One object, a tree, was struck in the path of the storm; but the discharge took place a half hour before the arrival of the funnel. The lightning-rod said to have been melted on Widow Dogget's barn might have been struck long before, and only noticed then because it was blown down.

There was no evidence of electrical action upon the trees, which were peeled and shivered by the storm, although there was that broom appearance where the trees were broken, which has been referred to the action of electricity. This, however, was clearly due to the straining of the tree before it broke.

No one saw any objects tipped with electrical light during the progress of the meteor. The telegraph was not interrupted until the wind blew down the wires.

The electrical phenomena must, therefore, be regarded as merely secondary, as the result of the very rapid condensation of the vapor of water due to atmospheric disturbances arising from other causes.

Explosion from rarefaction.

It is the generally accepted opinion that in tornadoes houses are frequently burst asunder when the center of the whirlwind comes over them. This is supposed to be accomplished by the great rarefaction, which is said to exist in the center, suddenly relieving the air within the houses of a large portion of atmospheric pressure. The air thus relieved of pressure immediately expands and blows the house asunder as with gunpowder. There was not, so far as I was able to learn, a single case in which a house was so destroyed. The houses were invariably demolished or blown from their foundations by a wind blowing in a certain direction. They were generally pushed or carried a considerable distance bodily, floor and all. After striking the ground with the foremost edge they turn partially over, thus exposing the floor to the wind. The wind being obstructed by the wall of the house resting on the ground became immediately compressed by the pressure from behind. The floor, unable to stand this pressure, went upward, and the whole interior of the building became subjected to a strong pressure due to the compression of the air. This pressure was more than balanced on the side struck by the wind. On the other sides there was nothing to resist it, and the house was accordingly burst asunder. Some of the houses, which were carried forward, evidently reached the center before striking the ground. Traveling with rapidity, they would cross the narrow interval of calm in the eye of the tornado, if such there be, in a small fraction of a second. Being then struck by a contrary wind they were shattered into fragments and dispersed. Such may have been the case with the houses of M. Davidson and Peter Marsh.

Some houses went to pieces the moment the doors and windows were blown in. This takes place by the same kind of explosion as that mentioned above, and which is due to the law that fluids press equally in all directions. If a window is blown in on the windward side of the house, and there is no outlet for the inrushing wind, the whole interior of the house is immediately subjected to a force equal, or nearly so, to that of the wind. Explosion accordingly takes place. In a case of explosion of this kind the floor of the house generally remained, and once at least the windward side of the house had merely fallen forward, when the other sides had left it. We have, therefore, ample proof of explosion by compression, but none whatever of explosion by rarefaction. When the tornado was raging with full fury no house could possibly stand on its foundations until the center came over it. If the tornado was not strong enough to blow down a house before it reached the center, the house remained standing, or was demolished by the winds in the rear of the storm-center.

The belief that at the center of the tornado there exists a rarefaction almost amounting to a vacuum, is the product of the formerly widely entertained theory that tornadoes are mere whirls of wind, generated by some such mechanical agency as the meeting of two opposing currents. According to this theory the low barometric pressure towards the center is the result of the centrifugal force generated by the whirl throwing the air away from the center. Now, that we know that the whirling motion is merely a result impressed upon the winds rushing toward the center of low pressure by secondary causes, our views respecting the amount of rarefaction in the eye of the tornado must undergo a change. Without doubt, the pressure there reaches its minimum, because thither the winds tend. That the progress of the inrushing winds is delayed by centrifugal force is certain, and as soon as the centrifugal force becomes equal to the centripetal the wind will cease to be accelerated toward the center. At that point they will ascend circling, and losing part of their circular motion by friction will be drawn nearer the center until it becomes the focus of most rapidly ascending winds.

The fact that there were no evidences of the bark of trees having been torn off by the sudden evaporation of the juices of the trees, due to the relief from pressure, has already in the statement of facts been sufficiently insisted upon.

The temperature at the center.

A great many witnesses felt somewhat cold as the storm passed over them. The temperature is easily calculated. We have assumed, from the data, an average temperature of 76° on the surface of the ground, and a relative humidity of 65 per cent. This gives a dew-point of 63° or thereabout. This sudden decrease of 13°, together with the wet, is sufficient to account for the coolness experienced.

The amount of rarefaction necessary to produce this diminution of temperature.

The lowering of the temperature at the center of the tornado is due to the work performed by the air in expanding under diminishing pressure. The amount of this expansion, and consequently of the diminution of pressure, is easily obtained from the equation $\frac{a+t}{a+t_1}=\left(\frac{v_1}{v}\right)^{x-1}$, (Zeuner's Grundzüge, p. 131,) where a = co-efficient of expansion = 491, t = initial temperature — 32, t_1 = final temperature — 32, v = initial volume, v_1 = final volume, and x = the relation between the thermal capacities of the air with constant volume and with constant pressure = 1.41. The initial temperature in the case of the tornado = 76°, and the final temperature 63°. Consequently, $t = 76 - 32 = 44$, and $t_1 = 63 - 32 = 31$. Let us take $v = 1$. Then $\frac{491+44}{491+31} = \left(\frac{v_1}{1}\right)^{1.41-1}$, or $\frac{535}{522} = v_1^{\ .41}$, or $v_1 = \left(\frac{535}{522}\right)^{\frac{1}{.41}} = 1.8219$. A cubic foot of air, therefore, expands in passing from the circumference to the center to 1.8219 cubic feet. But the pressure is inversely as the volume. Therefore, since the initial pressure was 28.5, $\frac{1x285}{1.8219}$ = the pressure when the dew-point is reached and the funnel commences, = 15.69 inches. This gives a diminution of 12.81 inches, corresponding to a pressure of about 6.40 pounds per square inch, or 922 pounds per square foot, an amount of potential energy more than sufficient to account for all the phenomena.

The form and dimensions of the visible funnel did not, therefore, depend upon the diminution of pressure alone, but also upon the temperature and relative humidity of the inrushing winds. Its presence accordingly does not indicate a certain invariable velocity of the wind. When the air is moist, as it always is over the sea, a very small diminution of pressure, and consequently a comparatively light wind, would suffice to develop the phenomenon of a visible funnel. When, on the contrary, the air is very dry, winds of the utmost possible violence could be produced without a visible funnel. The funnel of dark cloud, therefore, by no means indicates the limits of the ascending current. This renders the explanation of the hovering up and down of the lower end of the funnel easy of comprehension. Varying humidity along the path of the tornado would be sufficient to produce this phenomenon.

As the air ascends the pressure diminishes, and the funnel consequently increases in width. The diminution of pressure perpendicularly is symmetrical, and the result is the symmetry of the form of the funnel.

Did the tornado carry up water? Beyond a doubt; but just as it carried up any other body. Water, readily separating into small portions under the action of the wind, would be much more likely to reach the summit of the cloud than particles of solid matter, however fine. It is a common belief, not merely among the many but among men of science, that evaporation takes place rapidly within the vortex of the tornado or water-spout. The fact that the dark funnel is merely a cloud formed by the condensation of the vapor of air, the temperature of which has fallen below the dew-point, is sufficient to show the impossibility of this. Water, therefore, does not add to the power of the tornado. It passes up as a liquid and comes down as a liquid or solid. Even if it were evaporated by the tornado it would require precisely the same amount of heat to evaporate it as it would give forth upon being again condensed.

The sound.

Its loudness was extreme, yet of such a nature as to drown all other sounds without stunning. A man could stand by his house, as it was shivered to pieces, and not hear the noise of its breaking. Many likened it to heavy railroad-trains. To a few it appeared like the hum and whir of innumerable machinery. To others it resembled the roaring of the ocean, along a rocky shore, in a storm. To the soldier it recalled the rolling thunder of the battle-field. Those who were nearest to it were not aware of its terrific loudness.

B. Whitaker heard it, together with others, at the distance of sixty miles. He says that even at that distance it indicated great force. Doubtless it was heard much farther, but excited no attention, being attributed to some other cause. The barometric gradient inclined from Mr. Whitaker to the tornado, consequently the propagation of the sound received no help from the wind. Thunder has very seldom been heard at a greater distance than ten miles. The sound of the tornado was therefore six times louder than the loudest thunder. Heavy cannonading has been heard, it is said, at the distance of ninety miles, and "the report of a volcano at St. Vincent was heard at Demerara, three hundred miles off." The voice of the tornado is, therefore, one of the strongest known to art or nature.

The distances to which bodies were carried.

Leaves fell at Keota and Prairie City which must have been carried four miles. Shutters were carried three miles. A tire of a wagon-wheel was carried two miles. A pig was carried one and one-fourth miles. Doubtless many heavy bodies were carried much farther than any of these instances. Wagons and pigs, &c., disappeared, and the owners could find no trace of them. Only the ruins which were carried the shortest distance were recognized. There is no evidence, however, of anything heavier than leaves and mud having traveled farther than a mile from the vortex. They were carried along with it, it may be, for ten miles. This proves that these bodies either never reached so high as the centrifugal cloud, or, if they did so, were carried again into the vortex before reaching the ground. Hail fell at Sigourney, four miles from the center, containing fragments of grass and leaves, and particles of mud. These, therefore, were carried up into the centrifugal cloud, and were probably scattered over the whole region visited by the rain and hail storm.

Why the hail generally preceded the rain.

A drop of rain of the largest dimensions, falling through air of an average pressure cannot exceed a velocity of 34 feet per second. A hail, however, weighing ½ pound and measuring 4 inches in diameter can acquire a much greater velocity. The area of a circle 4 inches in diameter is 12.566 inches, or say 12½ inches. Before the motion of the hail ceases to be accelerated the air must oppose it with a resistance equal to its weight. A spherical surface experiences theoretically in its passage through the air only half that opposed to a plain surface. The roughness of the hail would considerably increase the retardation; but this would probably be more than counterbalanced by the fact that all of the hail were, more or less, flattened and cake-shaped, thus allowing the hail to assume in falling a position of least resistance. Hence, the air must oppose the hail with a pressure of $\frac{144}{6\frac{1}{4}} = 11.5$ pounds per square foot before its motion ceases to be accelerated. This corresponds to a velocity of forty-eight miles per hour, or 70.4 feet per second. Since the resistance of the air is directly as the density, the velocity possible to be attained would be doubled at the height of three or four miles. We thus perceive that the hail, although perhaps formed at a greater elevation than the rain, can yet, when large, reach the ground before it.

The enormous height from which the hail fell, and the vast thickness of the cloud, does away with the difficulty which many have experienced of conceiving how hail can be sustained a sufficient length of time in the air to allow it to grow to such large proportions.

The light which the tornado throws upon the higher currents of the atmosphere is valuable. At a height of from ten to fifteen miles, there was in Iowa a rapid current to the northeast.

The predominance of winds blowing parallel to the path of the tornado.

The width of the destruction on the right of the center of the storm-path was, we have seen, always greater than that on the left. Another fact of the same significance is that the tornado, when it first commences its destructive career, and when the black funnel hovers over the surface of the ground without touching it, manifests itself as a wind blowing in the line of the storm. The reason is evident. The winds blowing in spirals toward the center had, in addition to a motion along the spirals, a motion as constituent parts of the storm in the direction of its path and at the rate of thirty miles per hour. This increased the velocity of the winds on the right of the center, and diminished that of those on the left of it. The general barometric gradient being inclined from south to north, tended also to increase the velocity of the southerly winds and diminish that of the northerly.

The tornado in Illinois.

The general appearance of the tornado, as a whole, in Illinois, was somewhat different from that which it presented in Iowa. The ascending column of air was no longer on one side of the centrifugal cloud, but apparently near its center. Hence the witnesses generally describe the cloud, as it approached, as consisting of a dark cloud to the northwest, a less dark to the southwest, and a clearer space between. Mr. Roe saw what he conceived to be three streaks of rain, when the tornado was yet miles from him, with clearer spaces between them. My own conception is that the rain fell so densely on both sides of the whirl as to be perfectly black, and the clearer portion, through which some of the witnesses saw the sky, was directly under the whirling clouds, and before the funnel reached to the earth. Mr. Roe, I believe, saw the two descending sheets of rain and the funnel, now reaching to the earth, extending down between them, with clearer intervals on either side. The fact that the cloud now extended on both sides of the funnel, and that the sun was bending toward the western horizon, from which the storm was approaching, rendered accurate observation very difficult. Hence comparatively few persons saw the funnel distinctly. Hence the disagreement of the witnesses as to the direction of revolution. In Iowa all circumstances had combined in order to render precise observation easy. In Illinois the very reverse was the case. I shall, therefore, treat this portion of the subject in a few general remarks.

APHER, WASHINGTON, D. C.

The tornado developed energy in this State quite as great as that displayed in Iowa.
direction of revolution was the same. The disposition of the ruins was precisely
nilar. It showed the same, and even a greater, partiality for water-courses, turning
ruptly from its course in order to follow them. Its direction varied between north-
st and southeast, and was in the main easterly. At the moment when its velocity
ninished, and before reaching Spoon River, it poured down, close to the whirlwind,
d even on its very path, a perfect cataract of water. The height of the cloud must
ve been very great, for it was seen in the west for hours previous to its advent.
ere was less hail, and the sound was not so generally noticed as in Iowa.

The identity of the tornado in Iowa with that in Illinois.

When lost track of, the Iowa tornado was close upon the Iowa River, and traveling
the southeast. Its general course had, however, been easterly. A very severe rain-
rm passed over the district between its point of disappearance and the Mississippi
ver. Trains were delayed by it and bridges washed away. On the Mississippi itself
ne damage was done to shipping by a violent gust of wind, which accompanied the
n. At Monmouth there was a severe thunder-storm. Twenty miles to the south of
he tornado again struck the ground. It was at Youngstown at 5.45 p. m., or thereby.
om A. McKee's house, north of Washington, Iowa, to Youngstown, is a distance of
out sixty-three miles in a straight line. The tornado was at McKee's house at 3.10
m. The difference between 5.45 and 3.10 is 2.35. The discrepancy due to
ngitude is four minutes, very nearly. The time, therefore, consumed by the storm
traveling from opposite Washington, Iowa, to Youngstown, Ill., was 2 hours 31
nutes, or 2½ hours; 63 ÷ 2½ = 25⅕, which is, therefore, the velocity of the storm, in
les per hour, in a straight line. The length of the journey was materially increased
the crookedness of the path. This brings the velocity nearly up to that with which
e meteor traversed Keokuk and Washington Counties, Iowa. These facts, taken in
nnection, irresistibly lead me to the conclusion that the tornadoes in the two States
e one and the same.

The point where the tornado first struck the ground, on South Skunk River, is situ-
ed in 92° 20′ west longitude and 41° 15′ north latitude. It was finally lost track of
ar Peoria, in 89° 37′ west longitude and 40° 40′ north latitude. The whole motion
the tornado, therefore, was 2° 43′ east and 35′ south, or one hundred and forty-
ree miles east and forty-one miles south. The mean direction of its path was 24°
′ south and 65° 9′ east, and its whole motion one hundred and forty-nine miles. The
ookedness of its path renders its actual motion considerably greater.

My warmest thanks are due to Elias Colbert, of the Chicago Tribune, and the editors
the local newspapers at Washington and Sigourney, Iowa, for assistance rendered,
d especially for publishing an extensive list of questions concerning the tornado,
hich secured for me valuable information from persons residing at a distance.

Observer, Signal-Service, U. S. A.

PAPER 31.

THE STORM OF APRIL 14-18, 1873.

(With 9 maps.)

A storm-center that was found to exist in Dakota on the morning of April 13, con-
nued developing itself slowly over Nebraska and Kansas during the afternoon and
ght, with threatening weather and southeasterly winds in the Upper Mississippi and
issouri Valleys. Breckenridge, Minn., reported heavy snow the following morning, with
igh northerly winds. The storm now commenced moving eastward toward the lakes,
here cautionary signals, ordered up on the previous day, heralded its advent.
entral in Iowa on the afternoon of April 14, it appeared to be moving remarkably slow,
hile the pressure was diminishing very rapidly eastward to Lake Erie. After reach-
g Illinois, the midnight reports of April 15 showed that the storm-center had divided
self into a number of small but very distinct areas of barometric depressions, extend-
g eastward to the Alleghanies, with threatening and rainy weather in the Ohio
alley. The several small storm-centers united again during the following day,
ith the exception of one, which moved southeastwardly into the Carolinas. The
rmer storm-center now changed its easterly course to a northeasterly direction,
oving toward the lower lakes, but making very little progress; so much so, that the
enter remained almost stationary in Southern Michigan for sixteen consecutive hours.

The small area that had moved into the Carolinas also changed its direction, and a peared as a well-developed storm on the coast of New Jersey on the afternoon of Ap 17. That area of low barometer which was over Illinois, Southern Michigan, and t Ohio Valley on the 16th, continued over nearly the same portion of country, wi special storm-centers in Indiana and Lake Huron, up to the night of the 17th, when moved northeastwardly to Lake Ontario by the morning of the 18th, where it prevail as a very large area of low pressure over the entire lake region on the afternoon of t 18th. The midnight reports of this date, however, showed the storm to be confined the Saint Lawrence Valley, with rain and snow and brisk westerly winds over t lakes. Moving along the Saint Lawrence, it again united over New Brunswick wi that portion which had been moving along the Atlantic coast, and then disappeared b yond the limits of our stations. During the six days that this storm had been centr in the United States, its frequent changes of direction, its dividing and reunitin have made it, in many respects, one of the most remarkable storms traced by the sign service since its organization. Lake-navigation being still closed, no disasters occurr to shipping, yet its severity was felt in most lake ports, which had, however, been du warned of its approach.

PAPER 32.

CHRONOLOGICAL LIST OF AURORAS OBSERVED AT THE RESPECTIVE SI NAL-SERVICE STATIONS FROM NOVEMBER 11, 1870, TO JULY 31, 1873, I CLUSIVE.

NOTE.—The dates are those of the evening of the night of the aurora, or of t nearest 11 p. m. observation, or according to astronomical reckoning.

? placed *before* the name of a station indicates that the observed light may possib not have been an aurora.

? placed *after* the name of a station indicates that the date is doubtful, and may 1 day in error.

Abbreviations Used in the Press-reports.

Maine, New Hampshire, Vermont, Massachusetts, Connecticut and Rhode Island as the *New England States.*

New York, New Jersey, Pennsylvania, Maryland, District of Columbia and Virginia as the *Middle States*; and that part of those States lying east of the Alleghanies as the *Middle Atlantic States.*

North Carolina, South Carolina, Georgia and northern and eastern Florida as the *South Atlantic States.*

Eastern Mississippi, Alabama and northwestern Florida as the *Eastern Gulf States.*

Western Mississippi, Louisiana and eastern Texas as the *Western Gulf States.*

Sometimes the South Atlantic States, Eastern Gulf, that portion of Mississippi not included in the Eastern Gulf States, with Tennessee and Kentucky, are grouped together as the *Southern States.*

Lower Lakes, when used, means Lakes Erie and Ontario with adjacent territory.

Upper Lakes, when used, means Lakes Superior, Huron and Michigan with adjacent territory.

The *Northwest* means the country lying between the Mississippi and the Missouri rivers.

The *Southwestern States* means that portion of the Western Gulf States lying west of the Mississippi river, including Arkansas.

Pacific States includes California, Oregon and Washington Territory.

The *Ohio valley* includes the belt of country about two hundred miles broad from Pittsburgh to Cairo.

The upper *Mississippi valley* includes the belt of country about two hundred miles broad from St. Paul to Cairo.

The lower *Mississippi valley* includes a belt of country two hundred miles broad from Cairo to Vicksburg.

The *Missouri valley* includes a belt of country two hundred miles broad from Fort Sully to St. Charles, Missouri.

The extreme *Northwest* includes that portion of Dakota lying west of the Missouri river and the eastern portion of Wyoming and Dakota Territories.

The expressions "from Missouri to Ohio," &c., &c., refer to areas reaching to and including the central portions of the States named. Thus a report "Westerly winds extending from Iowa to Pennsylvania" would signify that these winds would be felt in the interior of those States, as well as over the territory lying between them of the respective States.

In "the Coasts, &c.," is included the land between the coasts and the parallel range of coast hills or mountains. In Texas, Louisiana and northern Florida, a belt of land extending a hundred miles inward would be included.

NOTE: From May 31 to June 30, inclusive, the four stations at Mount Washington are numbered Station No. 1, Station No. 2,, Station No. 3, and Station No. 4; the summit being No. 1 and the base No. 4.

PAPER 33.

A.

LEGATION OF AUSTRIA-HUNGARY,
Washington, May 6, 1873.

Mr. SECRETARY OF STATE: At the meeting of meteorologists at Leipsic, a series of questions were propounded for the purpose of bringing about greater uniformity in the meteorological labors of various countries, and greater unanimity in the development of this science, the influence of which upon the interests of navigation and agriculture is indisputable.

As a means of attaining this end, it is proposed to convene a congress of meteorologists, similar to the international assemblies which have met from time to time for the purpose of discussing scientific questions of international interest. It has been agreed that the congress shall commence its session next autumn, at the city of Vienna; and that a committee shall be appointed to take charge of the preparatory labors, said committee to be composed of the following gentlemen: Dr. H. Wild, Dr. C. Bruhns, and Dr. C. Jelinek.

In the fulfillment of this mission, Director Jelinek, on behalf of the committee, has just addressed a series of proposals to the imperial and royal minister of public instruction, asking at the same time, with a view to giving an official character to the projected congress, that these governments, which have hitherto favored the development of meteorological science, may be invited to send delegates, selected from among the heads of their meteorological institutes and the directors of observations having no connection with the State.

In consequence of this request, I have just received instructions from my government, Mr. Secretary of State, to send you ten copies of the report of the discussions which took place at the meeting of the meteorologists at Leipsic, and to invite, in its name, the Government of the United States to be pleased to take part in the projected congress, which will meet on the 1st of September, at Vienna, and which will remain in session for not more than fifteen days.

The encouragement which the Government of the United States has always afforded to the science in question, and the wonderful results which have been obtained by meteorological observations on this continent, renders its participation in the aforesaid congress in the highest degree desirable. I therefore entertain the hope that the Government of the United States will be pleased, in the interest of science and the general welfare, to join, by its representations at this congress, the experience of its meteorological institutes to the observations of the meteorologists of Europe, that thus the sphere of knowledge which is useful to mankind may be extended.

Be pleased to accept, Mr. Secretary of State, the assurance of my very high consideration.

LEDERER.

Hon. HAMILTON FISH,
Secretary of State, Washington.

B.

WAR DEPARTMENT,
Washington City, August 15, 1873.

SIR: Information having been communicated to this Department by the Department of State, that an invitation has been given by the Austrian government to the United States Government to take part in a congress of meterologists, to convene at Vienna on the 1st of September next, and the designation of a delegate to attend that congress having been committed to this Department, you are authorized to proceed to Vienna to represent the United States Government in the proposed congress.

You will inform the congress of the deep interest with which this Department regards whatever may relate to the advancement of systems of storm-warnings; and of its desire that an interchange of international telegraphic weather-reports may be extended as widely as possible.

Very respectfully, your obedient servant,

WM. W. BELKNAP,
Secretary of War.

Gen. ALBERT J. MYER,
Chief Signal-Officer, U. S. A.

C.

MEMORANDUM.

The exchange of simultaneous reports between Russia and the United States will commence with those to be taken on January 1, 1874. The hour of observation to be 7.35 a. m., Washington (local) time. The reports will be exchanged by mail, the packages to be mailed on the 15th and last days of each month. The reports to be as nearly as possible uniform in character and to exhibit at least pressure, temperature, wind, rain, relative humidity, and clouds.

F. C. WILD.

VIENNA, *September* 16.

D.

MEMORANDUM.

The exchange of simultaneous reports between Turkey and the United States will ommence with those to be taken on January 1, 1874. The hour of observation to be .35 a. m., Washington (local) time. The reports will be exchanged by mail. The ackages to be mailed on the 15th and last days of each month. The reports to be as early as possible uniform in character and to exhibit at least pressure, temperature, ind, rain, relative humidity, and clouds.

COUMBARY,
Directeur de l'Observatoire impérial météorologique de Constantinople.

VIENNA, *September* 16, 1873.

PAPER 34.

The following table shows the percentage of verifications of probabilities for each ivision or subdivision named for each month, the monthly percentage of all, the yearly ercentage of each, and the percentage of total verification.
